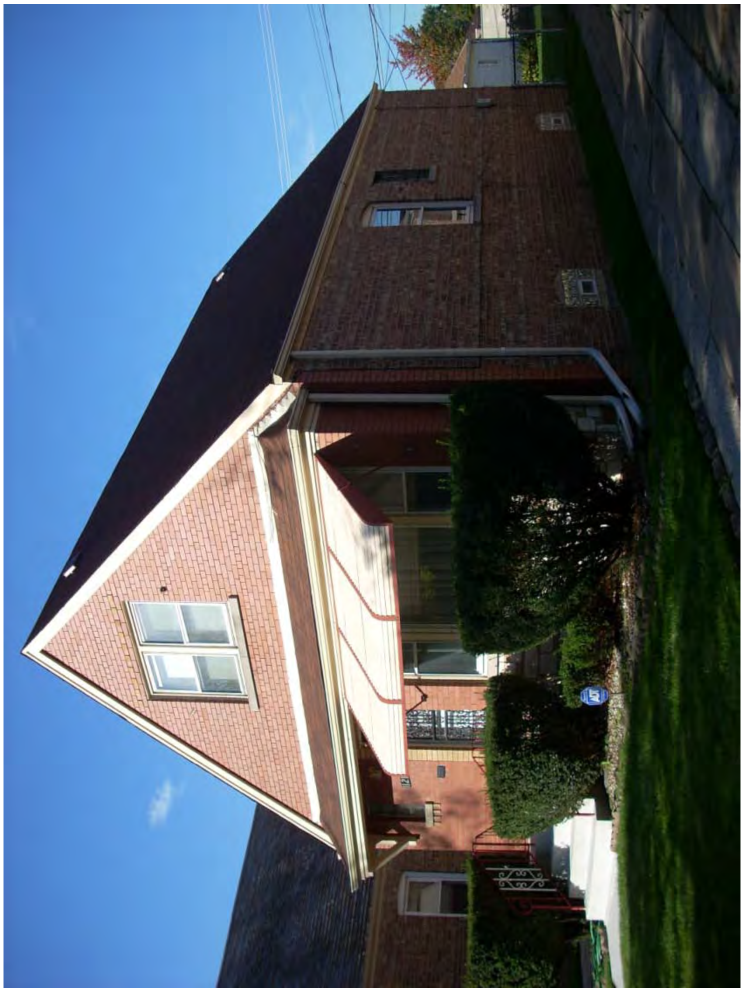
East and north façades of a one-story, single family, brick residence.



Property Description: **Stories:** 1

This one-story cottage in the Roseland community is situated on a raised basement with glass block windows and is clad with orange brick on the front elevation and common brick on the side and rear elevations. The building has a steeply pitched front gable roof covered with asphalt shingles. The front elevation has a pent roof, an off-center metal storm door surrounded by yellow brick, concrete steps with metal railings, and an adjacent glass block window. The projecting living room bay features a non-original picture window flanked by one-over-one aluminum-sash windows that are partially obscured by a low metal awning. This bay is clad in faux stone below the sill line. A pair of non-original one-over-one aluminum-sash windows is situated in the gable, and all windows have concrete sills. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

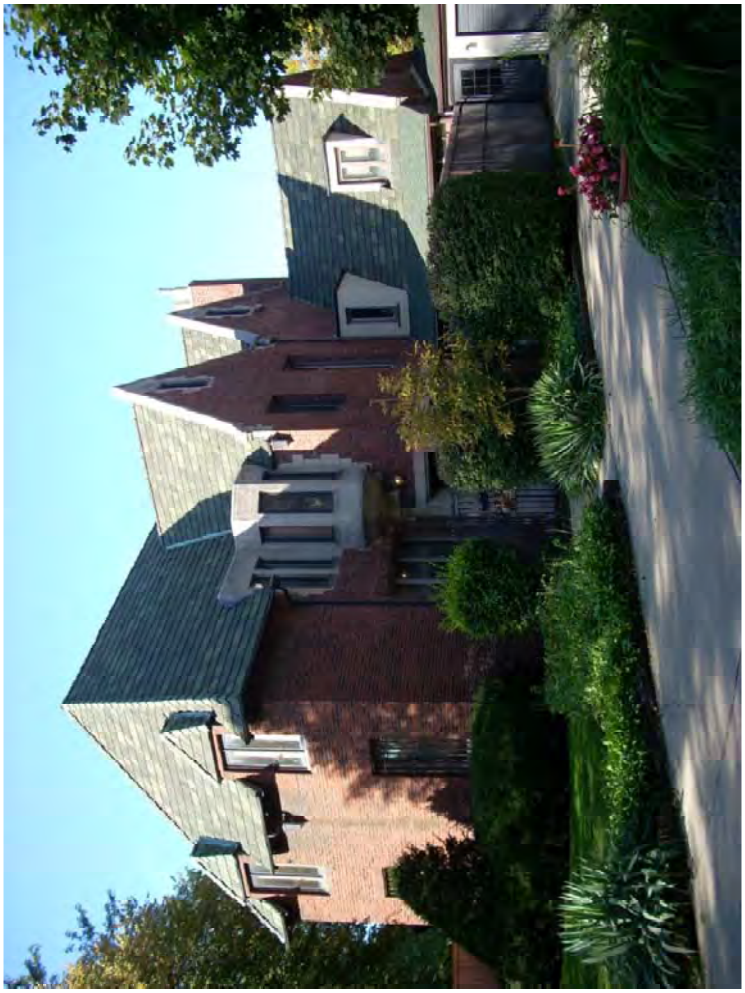
Photos with Captions:
North and east façades of a brick, two-story single family residence.



Property Description: **Stories:** 2

This two-story asymmetrical French Eclectic style house in the Roseland community was built for Stuart Colman. It is clad with brownish-orange face brick. The building has a steeply pitched roof covered with slate, a pair of gabled pavilions along its north elevation, and an L-shaped footprint with a one-story side-gabled wing that features two flat-roofed dormers. The front elevation of the main block has two windows on the first floor that are obscured by metal grates and two through-the-cornice wall dormers with paired casement windows. The recessed front door has a smooth stone surround and a stone-clad upper story oriel is situated at the juncture between the front wing and its adjacent gabled pavilion. Attic windows in the paired gable pavilions are surrounded by stone quoins. Fenestration appears to be mainly casement windows. This is an unusual example of a French Eclectic style home in Roseland and stands as a visual landmark among the predominant building stock of cottages and bungalows. Although windows appear to be replacements, overall it has very good integrity and is recommended as individually eligible for National Register listing.

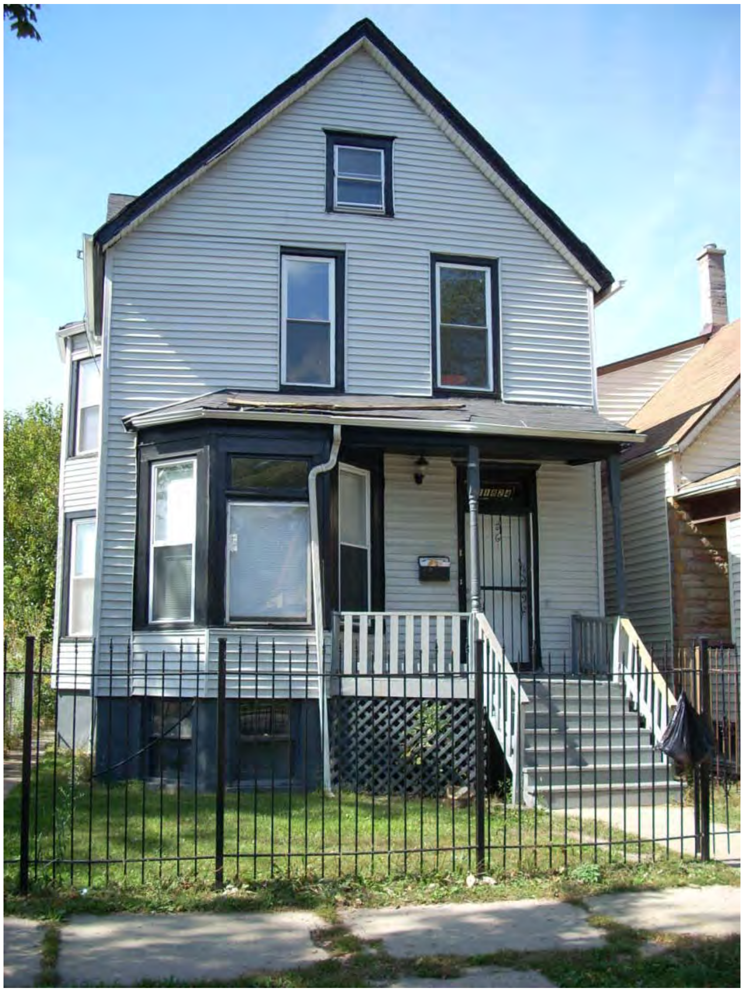
East façade of a two-story, multi-family, frame residence.



Property Description: **Stories:** 2

This two-story frame house in the West Pullman neighborhood is situated on a raised brick basement that has been covered with concrete. Above, the house is covered with synthetic siding. The building has a cross-gable roof covered with asphalt shingles. Its front elevation has a partial-width wood porch; its hipped-roof of which spans the full façade to also shelter the adjacent three-sided window bay, which has a central non-original fixed-pane window with transom flanked by non-original one-over-one aluminum-sash windows. The porch has an off-center non-original hollow core metal door with a transom, wood posts, steps and straight railings. There are two windows on the second floor of the front elevation and one in the gable, all of which are non-original one-over-one aluminum-sash. The south elevation has a two-story three-sided window bay. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

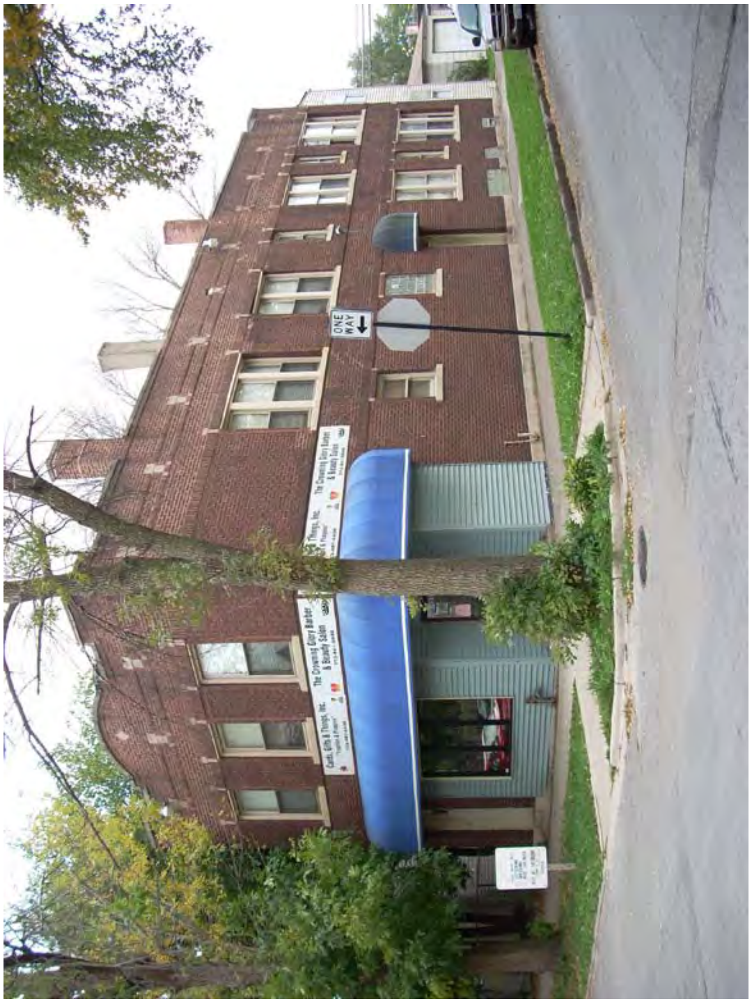
North and east facades of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story mixed-use building at the southwest corner of Emerald Avenue and 123rd Street in the West Pullman community is clad with brown face brick along its two street elevations. The building has a flat roof and a parapet that is rounded at the center of the Emerald Avenue elevation. The building has a non-original corner storefront with synthetic siding, a strip of three fixed-pane windows, and a mirrored glass corner door in the recessed corner entrance vestibule. The Emerald Avenue elevation has an off-center doorway with a non-original door that provides access to the second floor. An additional entrance with a non-original hollow core metal door is situated along the 123rd Street elevation. The first floor of the 123rd Street elevation and the building's second floor features one-over-one wood-sash windows arranged by themselves, in pairs, and in groups of three. One of these openings on the first floor has been in-filled with glass block. Detailing includes concrete sills, decorative square insert blocks at the parapet level, and brick stringcourses. This building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

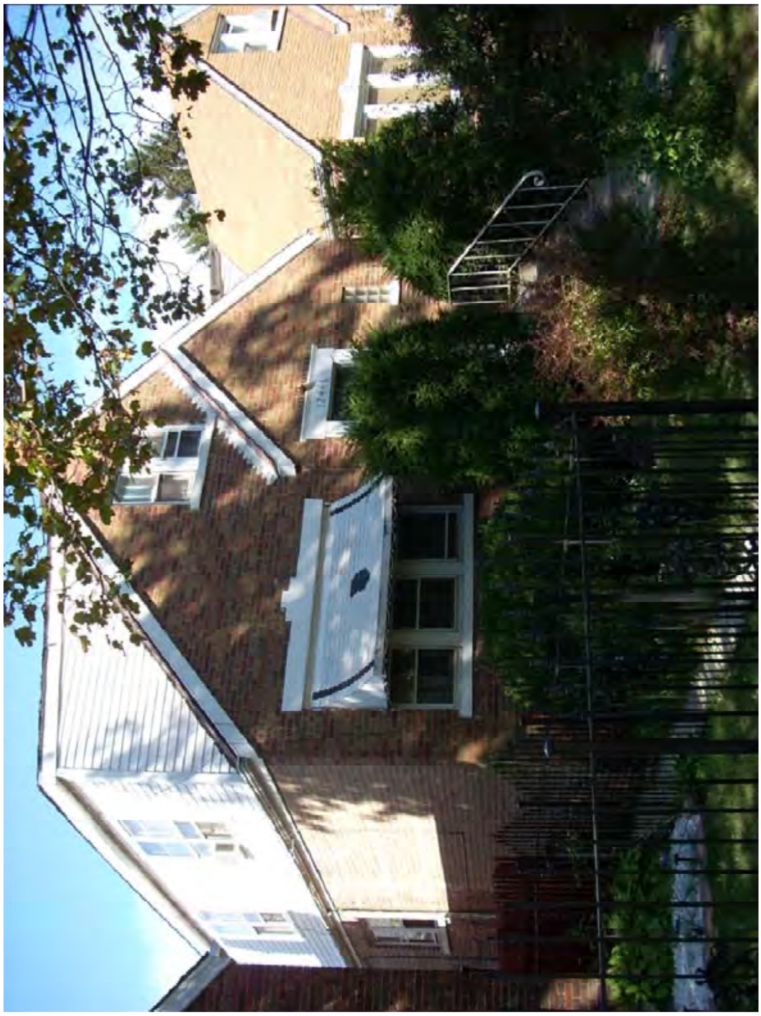
East and south façades of a 1.5- story, single family, brick residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story in the West Pullman community is situated on a raised basement and is clad with face brick on its front elevation and common brick on its side and rear elevations. The building has a front gable roof covered with asphalt shingles and a wide, shed-roofed, synthetic-clad dormer addition along the south slope of the roof. The front elevation has a slightly projecting gabled entrance vestibule with a non-original hollow core metal door and a Classical wood surround consisting of fluted pilasters and cornice. The building also includes concrete steps with metal railings, a strip of three double-hung windows with metal awning and a lintel on the first floor, and a pair of three-over-one wood-sash windows in the gable. Windows feature concrete sills. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

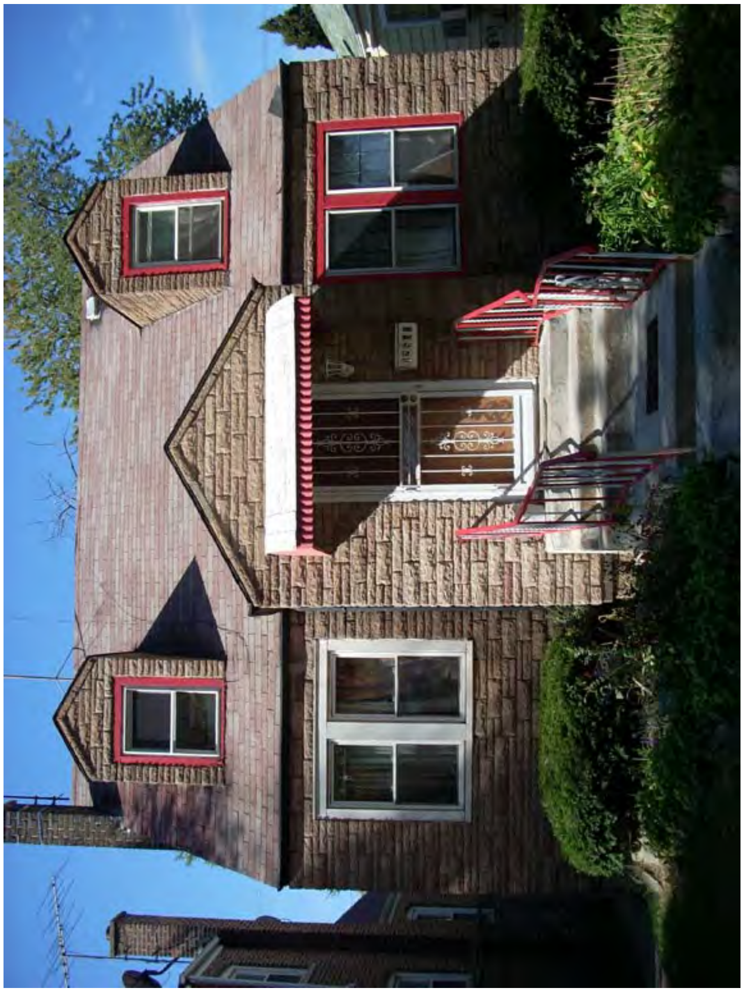
East façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story home in the West Pullman community is clad with a stone veneer on the front elevation with asbestos or wood shingles on the other elevations. The building has a side-gabled roof covered with asphalt shingles and two gable dormers, each of which has a non-original one-over-one aluminum-sash window. The front elevation has a centrally located gabled vestibule with a metal storm door, concrete steps with metal railings, and paired windows on either side. One pair features original six-over-one wood-sash windows and the other has non-original one-over-one aluminum sash. It does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

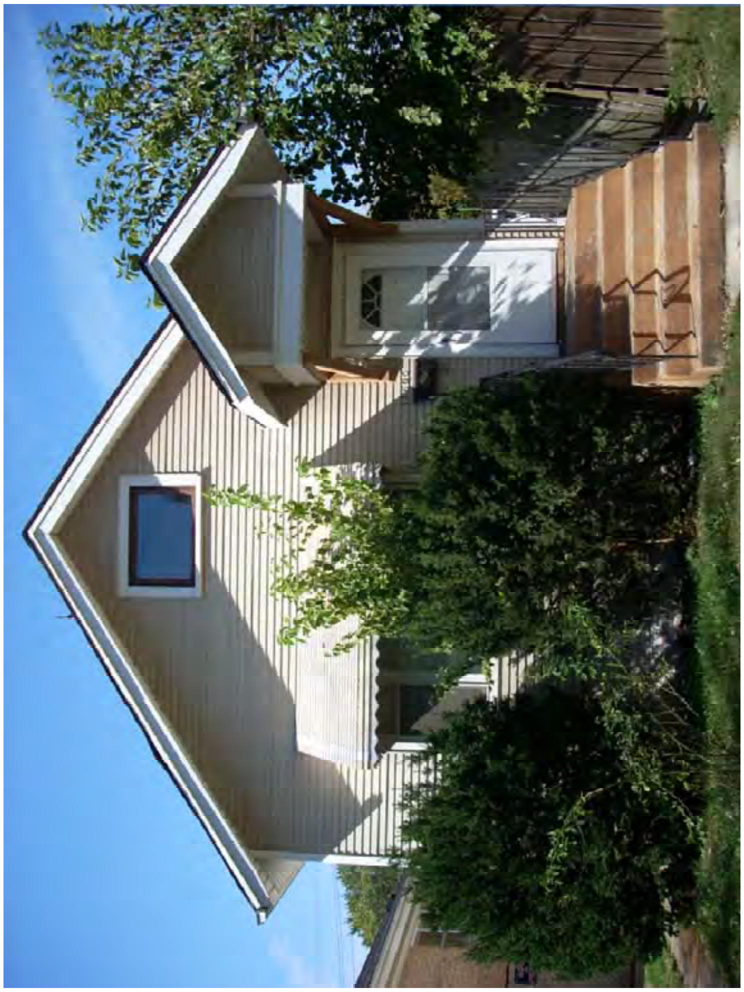
East façade of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame cottage in the West Pullman community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. The front elevation has an off-center hollow core metal door with a wood bracketed boxed gable hood, and concrete steps with metal railings. There is a group of three windows on the first floor (fixed-pane flanked by double-hung sashes) and a single pane window in the gable. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

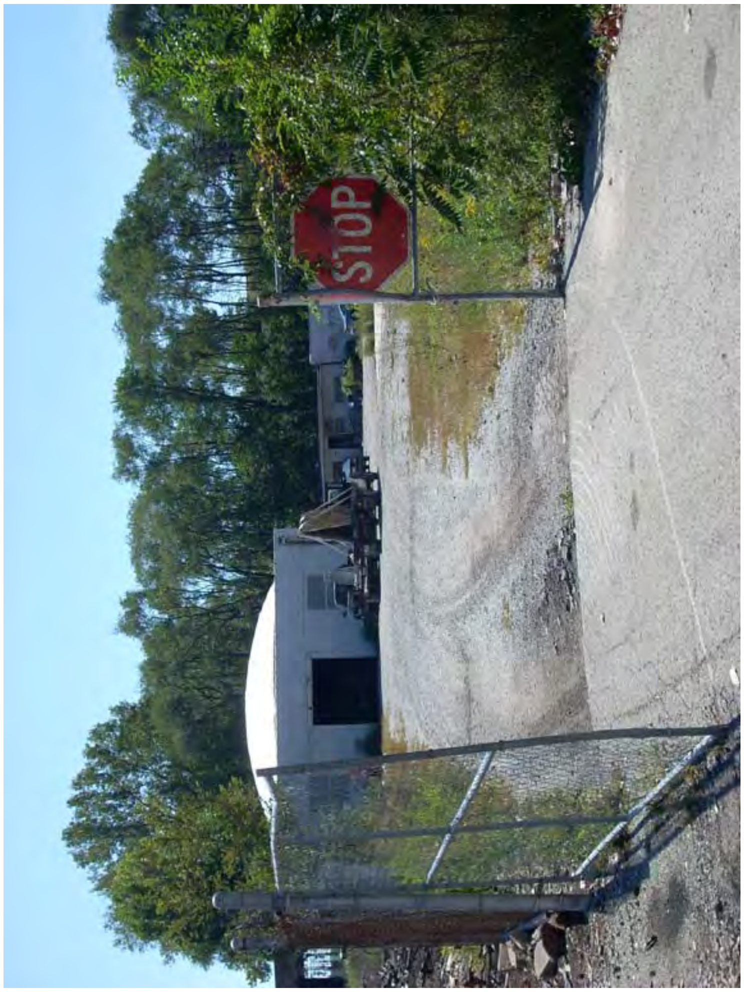
Looking south at light industrial complex.



Property Description: **Stories:** 1

This concrete block, Quonset utility outbuilding in the West Pullman community is set back from the public right-of-way and has a front elevation with a centrally located garage door opening flanked by a one-over-one window on either side. The 1962 aerial photograph shows two buildings on the property, the extant Quonset and a larger building. The larger building was razed between 2007 and 2012. A one-story building and a trailer standing on the remaining concrete slab from the larger, razed building are also part of this complex but too far from the road for evaluation. Windows appear to be fixed-pane on all buildings within the complex. This building complex does not have distinguishing architectural features and is not individually eligible for listing on the National Register.

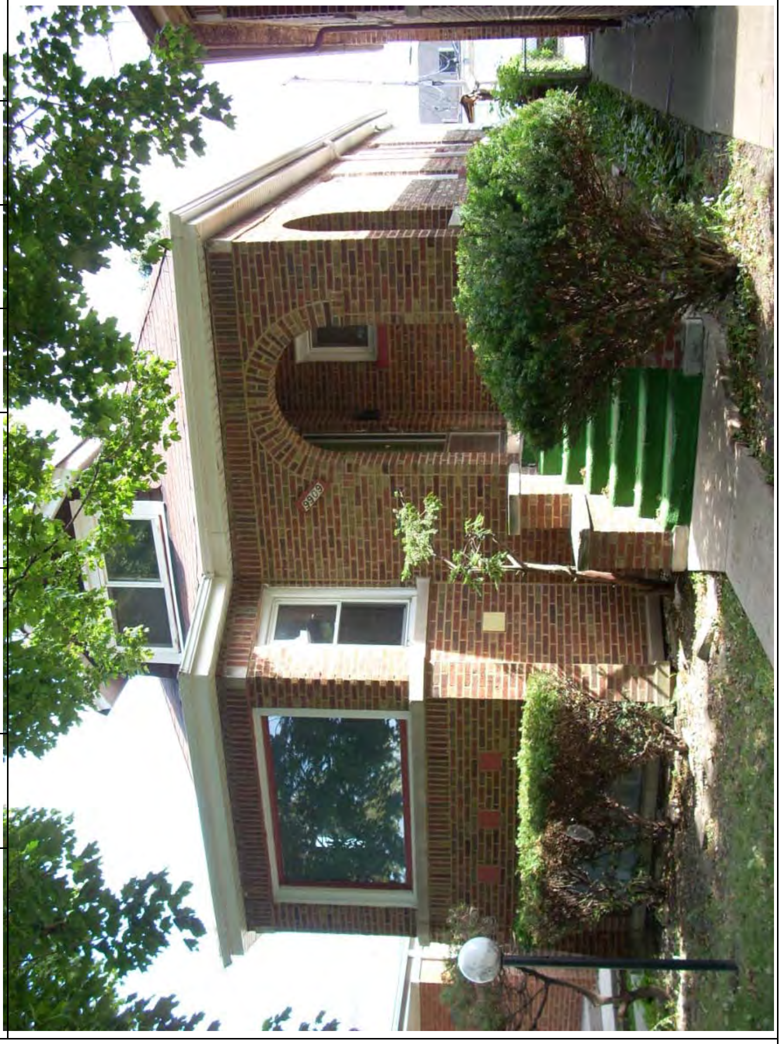
Chicago Style Bungalow

Prepared By: C. Tolmie, M. C. Bird, J. Guarino

Photo By: S. Katz

Date: September 2012

Photos with Captions:
West façade of brick, one-story, single-family residence.



Property Description: **Stories:** 1

This one-story brick-clad bungalow in the Washington Heights community sits on a raised basement. The building has a hip roof covered with asphalt shingles, overhanging eaves, and a gable dormer with a pair of single-pane windows. The door is tucked into one side of the three-sided living room bay, which has a non-original central picture window flanked by one-over-one aluminum-sash windows. Its front elevation also has a recessed corner porch with two round-arch openings, concrete steps with low brick sidewalls, and a casement window. Details include an archway on the porch, decorative brickwork, and stone inserts above and below the window bay.

This is an example of a brick “Chicago Style Bungalow,” a building type that the City of Chicago has recognized through its Historic Chicago Bungalow Initiative. However, this house lacks distinctive architecture features and is not individually eligible for listing on the National Register.

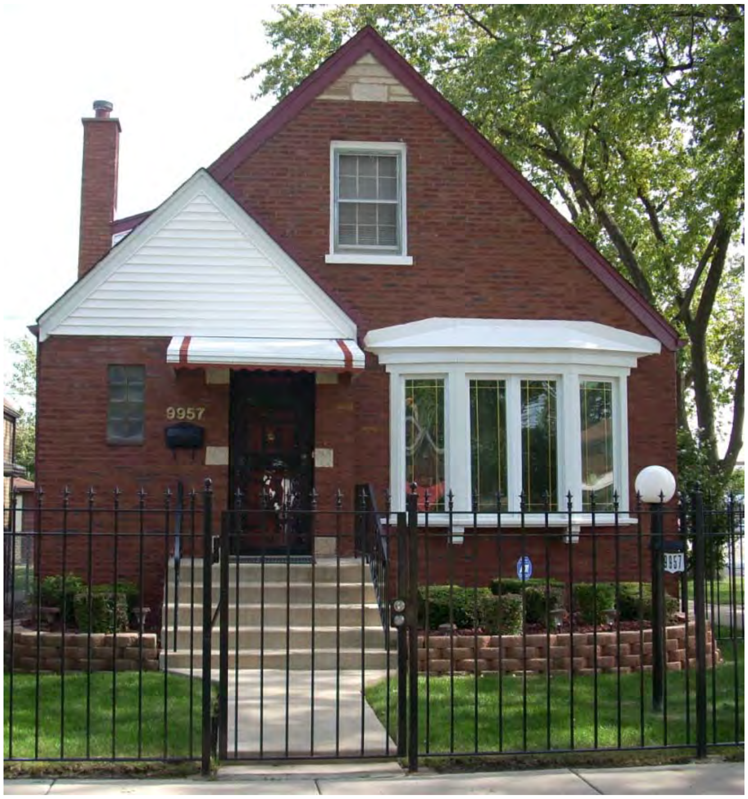
West façade of one-story, brick, single-family residence.



Property Description: **Stories:** 1

This one-story brick-clad cottage at the northeast corner of Green and 100th streets in the Washington Heights community is situated on a raised basement and has a front gable roof covered with asphalt shingles. Its front elevation has a brick-clad gable entrance vestibule with a metal storm door topped by a metal awning and concrete steps with metal railings. Windows include a small glass block window by the door, a bow window with four casements on the first floor, and a single six-over-six window in the gable. Detailing includes decorative stones flanking the door and at the apex of the gable. The side (100th Street) elevation includes a flat-roof wall dormer with a small glass block window, a side door with a metal storm door, a concrete stoop with metal railings, and a metal awning. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

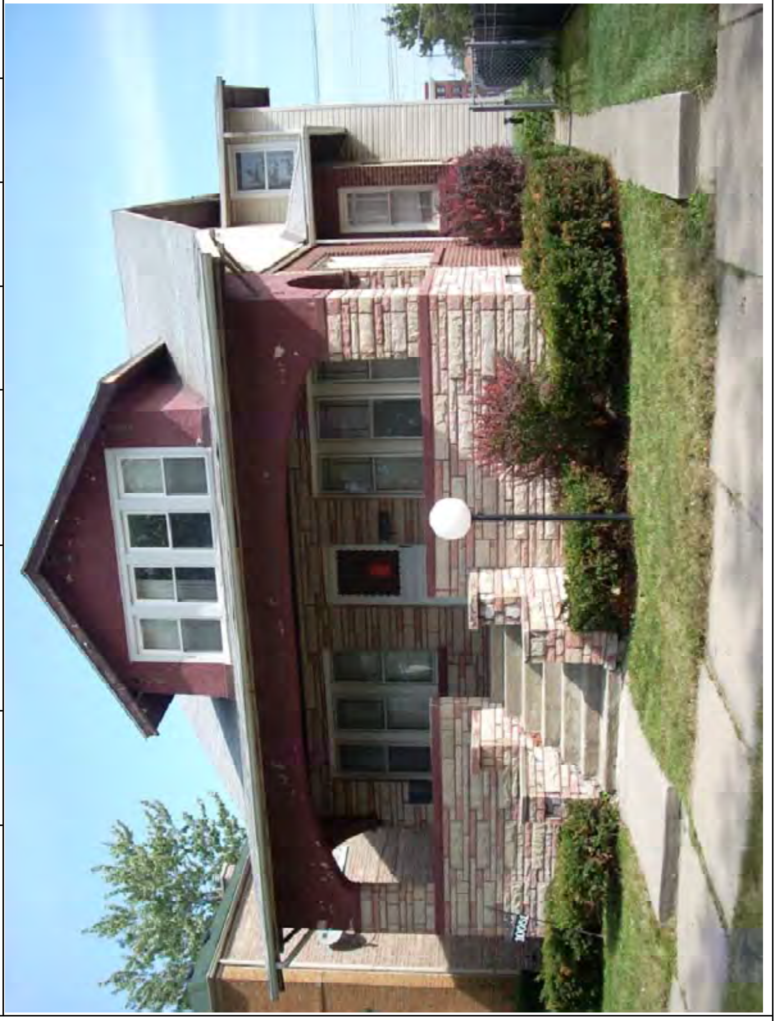
West façade of one-story, masonry, single family residence.



Property Description: **Stories:** 1

This single story Craftsman bungalow in the Washington Heights community is situated on a raised basement and is clad in faux stone, brick, stucco, and synthetic siding. The building has a side-gable roof with asphalt shingles, overhanging eaves with the brackets removed, and a front-gable dormer with a strip of non-original one-over-one aluminum-sash windows. The front elevation is clad with faux stone and stucco. The roof extends forward to shelter a full-width porch that has faux stone corner piers, low sidewalls, and concrete steps. The centrally located front door is flanked by a strip of three double-hung non-original windows on either side. The side elevations are clad in brown brick and have stucco-covered gables. The south elevation has an original hip-roof living room bay, behind which is a synthetic-clad, two-story addition. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

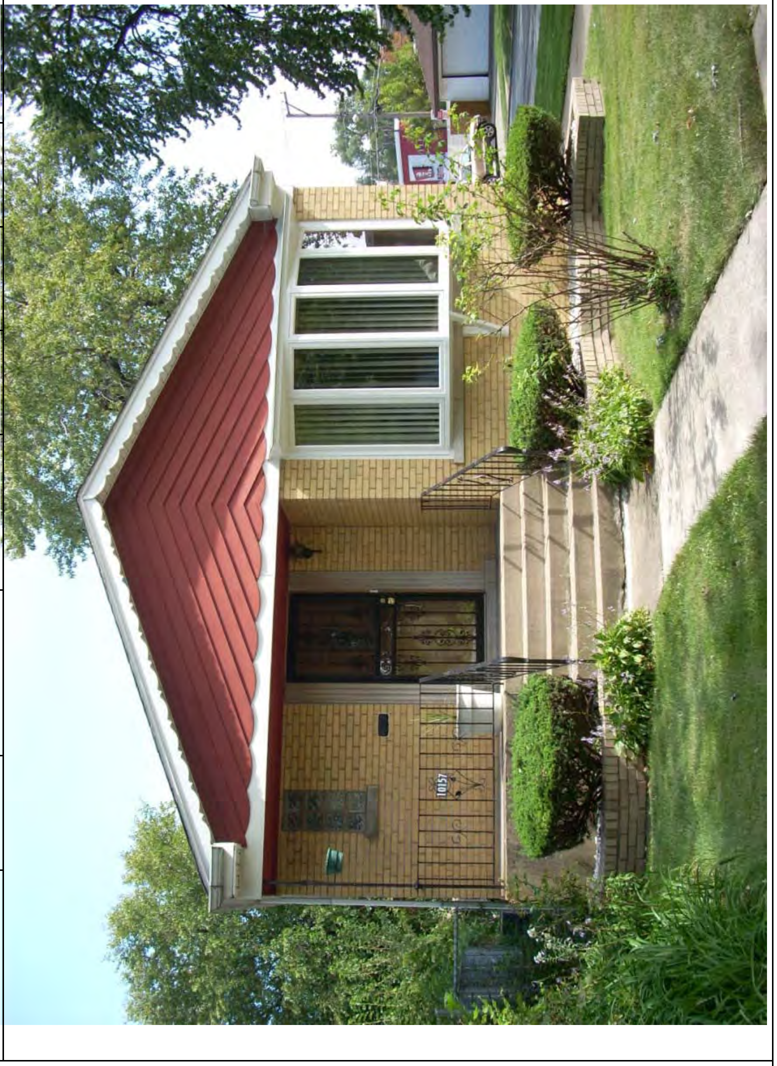
West facade of brick, one-story, single-family residence.



Property Description: **Stories:** 1

This one-story house at the northeast corner of Green and 102nd streets in the Washington Heights community is situated on a raised basement with glass block windows and is clad in yellow brick on its two street elevations. The building has a front gable clad in diagonally installed synthetic siding and framed by scalloped verge boards; asphalt shingles cover the roof. Its front elevation has a projecting living room bay with a bow window comprising four casements. It has a metal storm door with a stone surround, a small glass block window, and a partial-width porch with concrete steps, metal railings and open metal supports. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

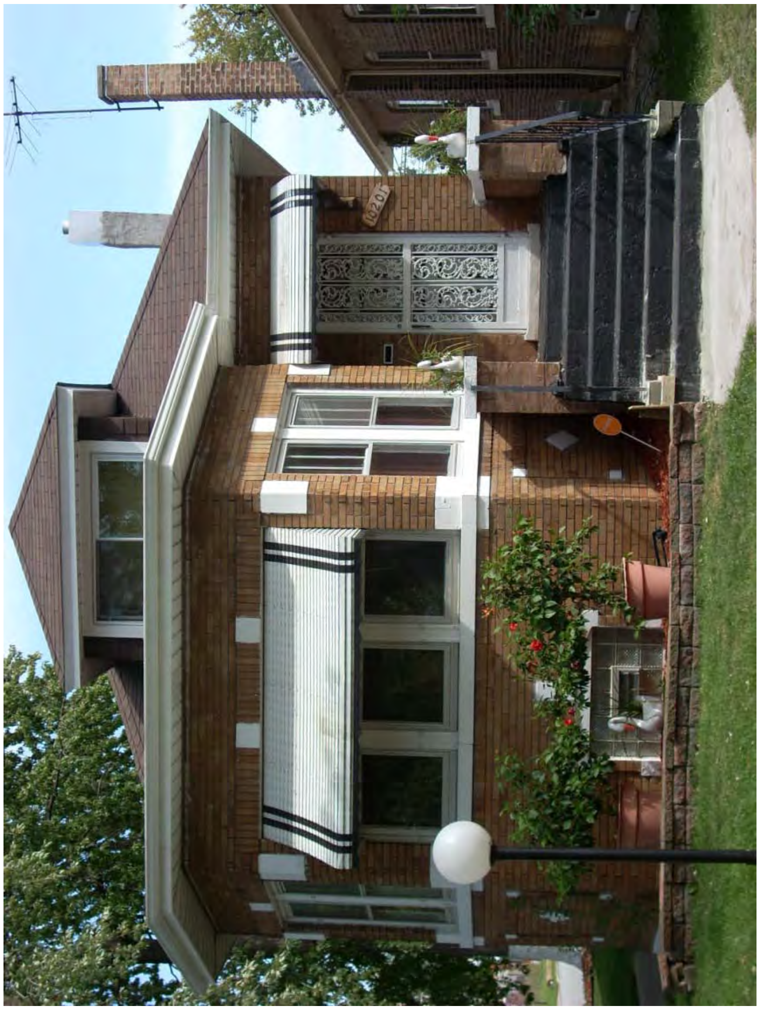
West facade of one-story, brick, single-family residence.



Property Description: **Stories:** 1

This one-story brick-clad bungalow at the southeast corner of Green and 102nd streets in the Washington Heights community is situated on a raised basement with glass block windows. The building has a hip roof with asphalt shingles, overhanging eaves, and hip dormers with paired non-original single-pane sliding windows along its front and north elevations. The front elevation has a flat roof projecting living room bay surrounded by non-original double-hung windows, the central grouping of which is partially covered by a metal awning. It also has a decorative off-center metal storm door with a metal awning, concrete steps with low brick sidewalls, and metal railings. Detailing includes brick panels along the base of the living room bay, soldier brick lintels, and square concrete insert blocks used as decorative accents. This is an example of a Chicago Style Bungalow, a building type that the City of Chicago has recognized through its Historic Chicago Bungalow Initiative. However, this house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

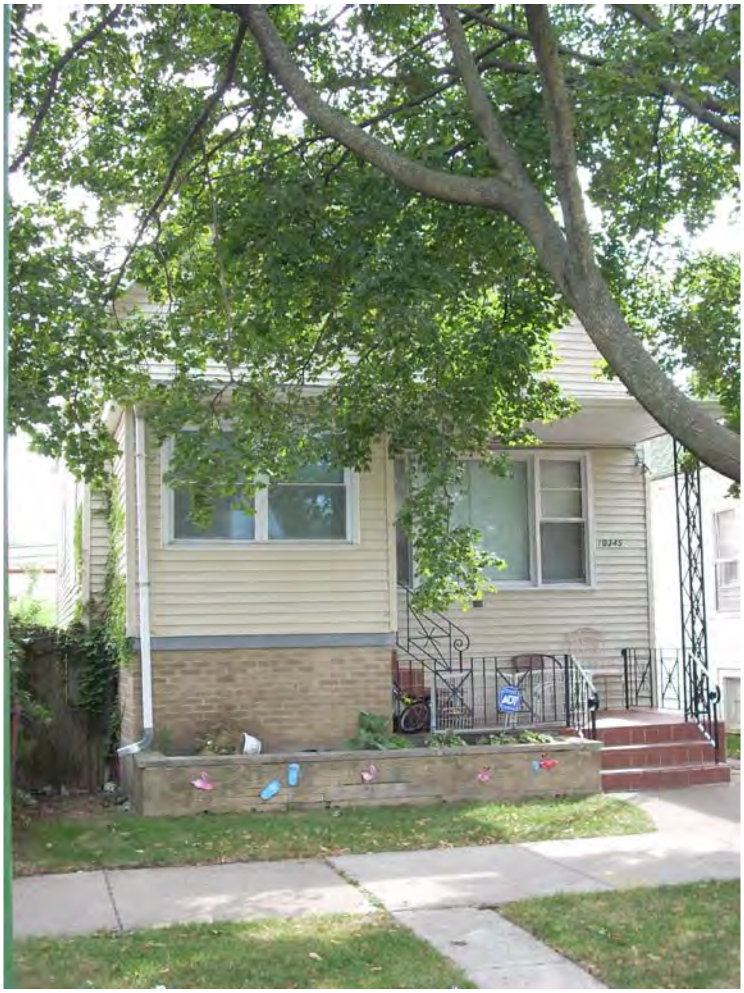
West façade of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Washington Heights community is situated on a raised brick basement and is covered with synthetic siding. The building has a hip-on-gable roof with a dormer. The front elevation has a full-width, flat-roofed porch, half of which is enclosed as a sunroom with a door tucked into its side. The open half of the porch has a metal corner support, metal railings and a clay tile deck with two steps. Fenestration on the front elevation includes a pair of non-original one-over-one aluminum-sash windows and a non-original picture window flanked by one-over-one aluminum-sash windows. A low, light brown colored brick planter stretches across the width of the sun porch. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

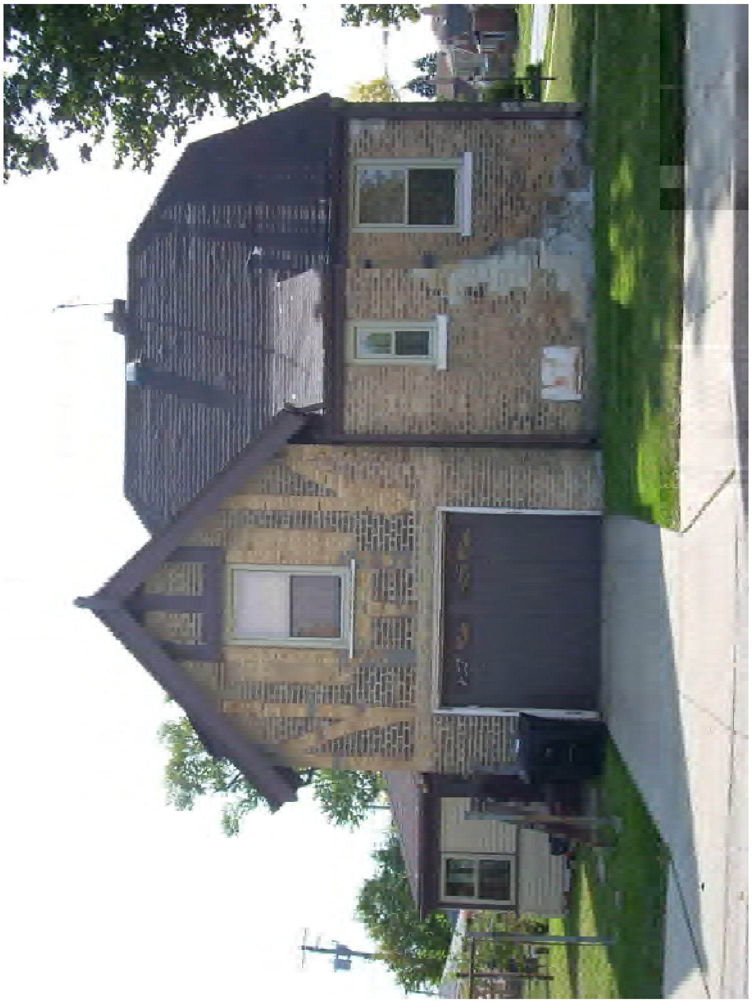
West façade of a one-story single family, brick residence.



Property Description: **Stories:** 1

This one-story, brick clad house in the Morgan Park community is situated on a raised basement with glass block windows. The building has a hip-on-gable roof with a gable garage facing the street. The house’s front entrance is located within a vestibule that is topped by a shed-roof, is brick-clad, and is located in the ell created by the main section of the house and the gable garage. It has a hollow core metal door, concrete steps, and metal railings. The front elevation has a non-original aluminum-clad first floor bay window and two additional pairs of non-original aluminum-sash windows: one on the first floor and one in the gable. The north elevation has an overhead garage door and a one-over-one aluminum-sash window. Detailing includes decorative stonework at the corners of the house, vertical half-timbering in the north gable (much of which has been removed), and concrete sills. This house does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

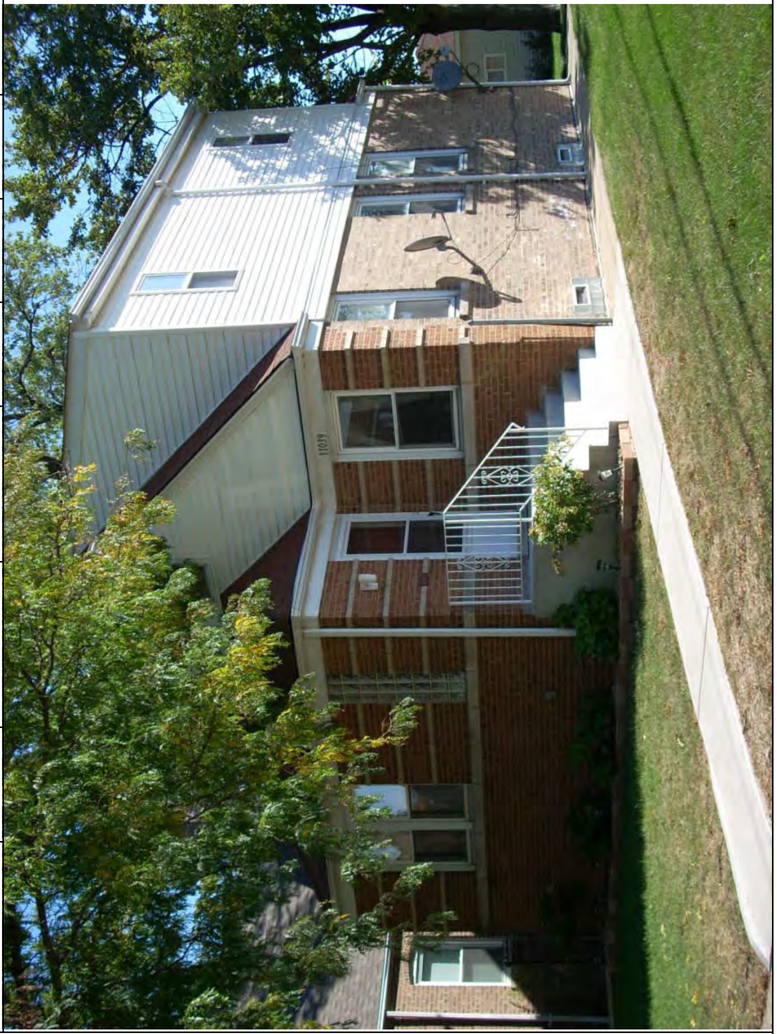
West and south façades of two-story, brick and frame, single-family residence.



Property Description: **Stories:** 2

This two-story house in the Morgan Park community has a brick-clad first floor, a synthetic-clad second floor, and a gable roof covered with asphalt shingles. The front elevation has a hip-roofed enclosed front porch with a side entrance door, concrete steps, and metal railing. There are three one-over-one aluminum-sash windows and one glass block window on the first floor front façade and a single one-over-one on the second. Detailing includes a stone sill course and buff brick stringcourses. The second floor on this house is a later addition. This home does not feature sufficient integrity or distinguishing features to qualify as eligible for individual listing on the National Register.

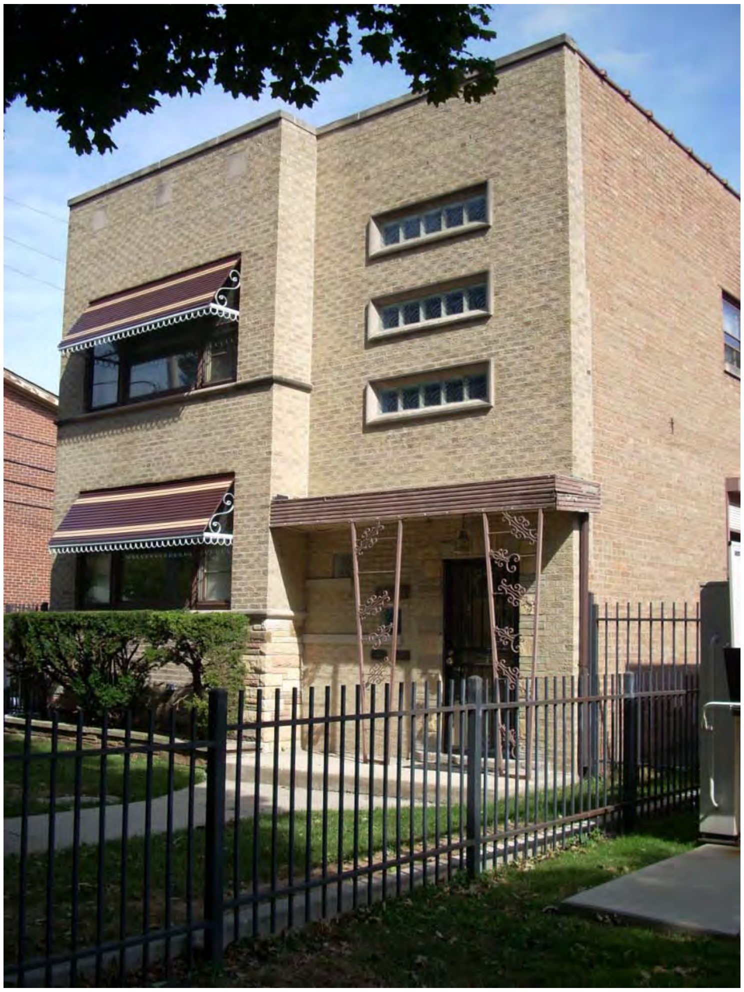
West façade of a two-story, brick, multi-family residence.



Property Description: **Stories:** 2

This two-story residential building in the Morgan Park community is situated on a raised basement with glass block windows and is clad with buff brick along the front elevation and with common brick along the side and rear elevations. The building has a flat roof and parapet. The north half of the front elevation has a full-height rectangular pavilion, both floors of which feature a window group comprised of a picture window flanked by one-over-one aluminum-sash windows with metal awnings. The south half of the front elevation has an off-center hollow core metal door, a flat-roofed canopy with two open metal supports, and a concrete stoop. Detailing includes decorative glass blocks adjacent to the door and three horizontal strips of glass blocks on the second floor, above the entrance. This building lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

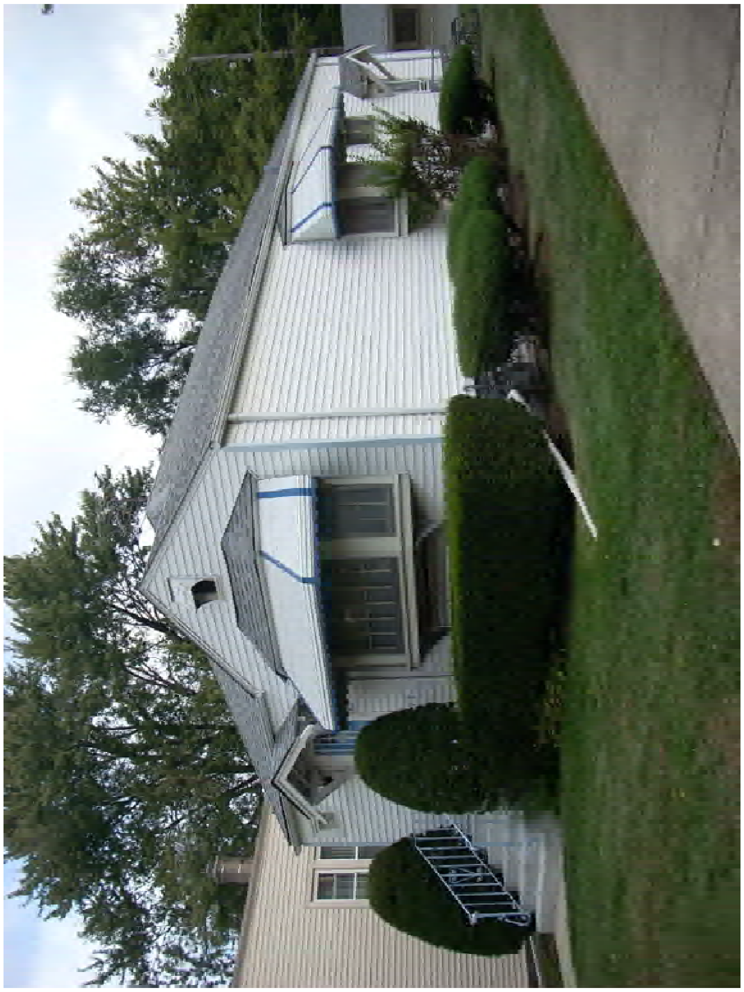
West and south façades of a one-story, single family residence



Property Description: **Stories:** 1

This one-story frame bungalow at the northeast corner of Green and 124th streets in Calumet Park is situated on a raised concrete block basement and is covered with synthetic siding. The building has a hip roof covered with asphalt shingles. Its front (Green Street) elevation has an off-center door with a bracketed gabled hood, concrete steps with metal railings, and a small casement window adjacent to the door. The elevation also has a gabled projecting living room bay with a bracketed, hip-roofed, three-sided bay window with multi-light glazing that is partially obscured by a low metal awning. There is a small window with a metal awning in the gable. The side elevation (124th Street) also has a bracketed, hip-roofed, three-sided bay window with multi-light glazing that is partially obscured by a low metal awning and a side entrance door with bracketed gabled hood. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

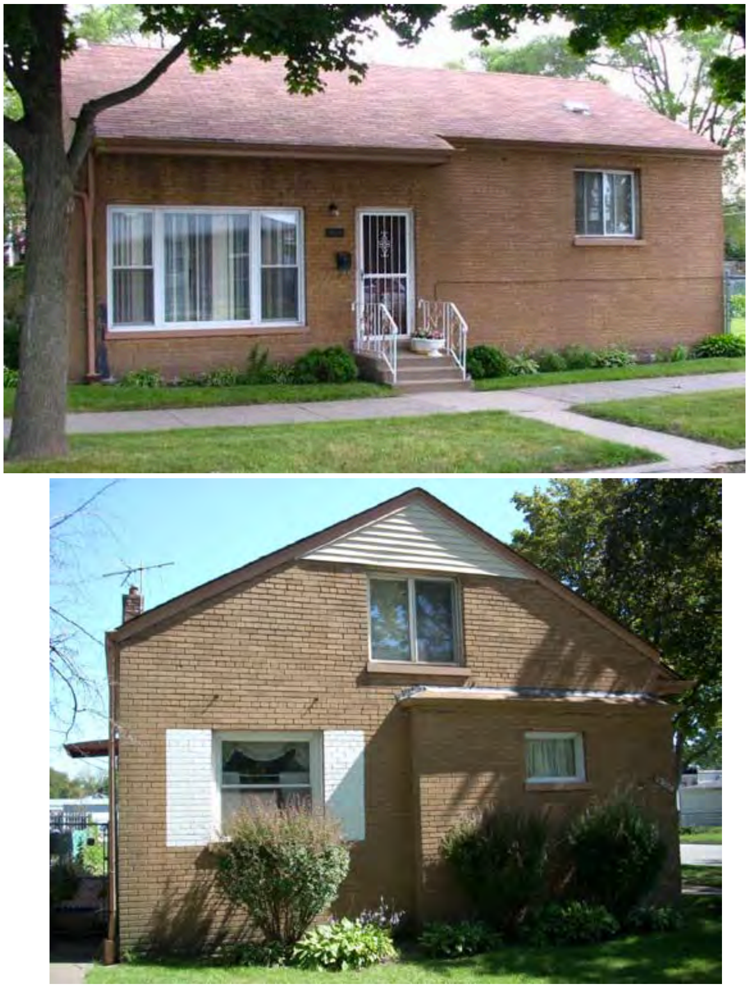
North and east façades of one-story, brick single family residence (top and bottom, respectively).



Property Description: **Stories:** 1

This one-story brick-clad house in the West Pullman community has a side gable roof covered with asphalt shingles. The front façade has a centrally located door and an asymmetrical array of windows—a sliding window on one side with a picture window flanked by one-over-one sashes on the other side. Fenestration on the side elevation is comprised of a one-over-one window, a single-pane window, and sliding windows in the gable. This standard post-WWII home does not feature any distinguishing architectural features and is not individually eligible for listing on the National Register.

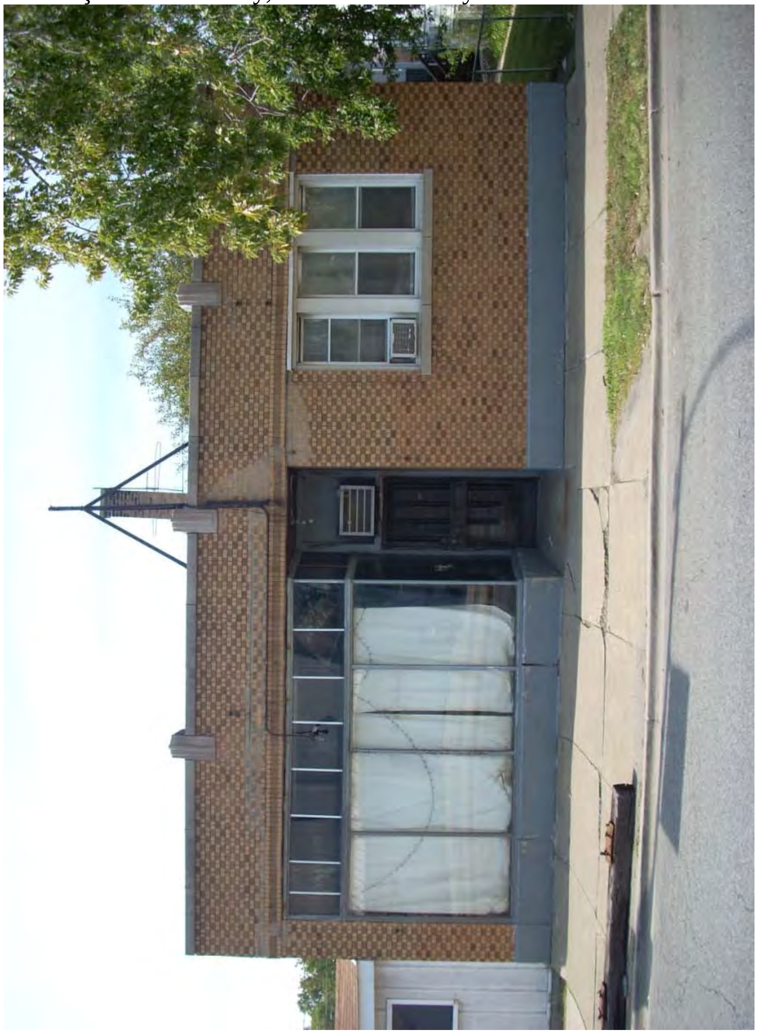
East façade of one-story, brick multi-family residence



Property Description: **Stories:** 1

This one-story brick-clad building in the Washington Heights community has been converted from a commercial structure to a multi-family residence. It has a concrete water table, flat roof, and parapet with concrete coping and inserts. Brick stringcourses traverse the cornice. Its front elevation has a centrally located recessed metal door with an in-filled transom, a strip of storefront display windows to the south, and a strip of non-original one-over-one aluminum-sash windows to the north. This building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This vacant, two-story, Classical Revival style substation building in the Washington Heights community has a stone water table and a flat roof with parapet. The front façade is clad with dark brown-colored brick that accents the façade with stringcourses, soldier courses, and cruciform patterns against the reddish brown-colored brick. The sides and rear feature common brick. The front elevation features a centrally located entrance with a Classical surround that includes Ionic columns and an entablature with a segmental pediment and frieze band with incised lettering that reads, "Southwest Substation." The original door, sidelight and transom have been removed and their openings covered with plywood. Directly above the entrance is a strip of three plywood-covered window openings with stone casing. Decorative detailing includes full-height brick corner pilasters, a stone belt course above the windows, and a stone cornice with widely spaced dentils. Directly beneath the cornice is a stone panel with incised lettering that reads, "City of Chicago Dep't of Gas & Electricity." Nearly all of the side elevation window openings are covered with plywood. This is a rare extant example of a Classical Revival substation building in the Washington Heights community. It has retained its decorative detailing, and it is possible that original windows may be extant behind the wood covering. Assuming that the interior has retained interior fabric, this building is recommended as individually eligible for listing on the National Register under Criterion C for architecture.

Structural Survey

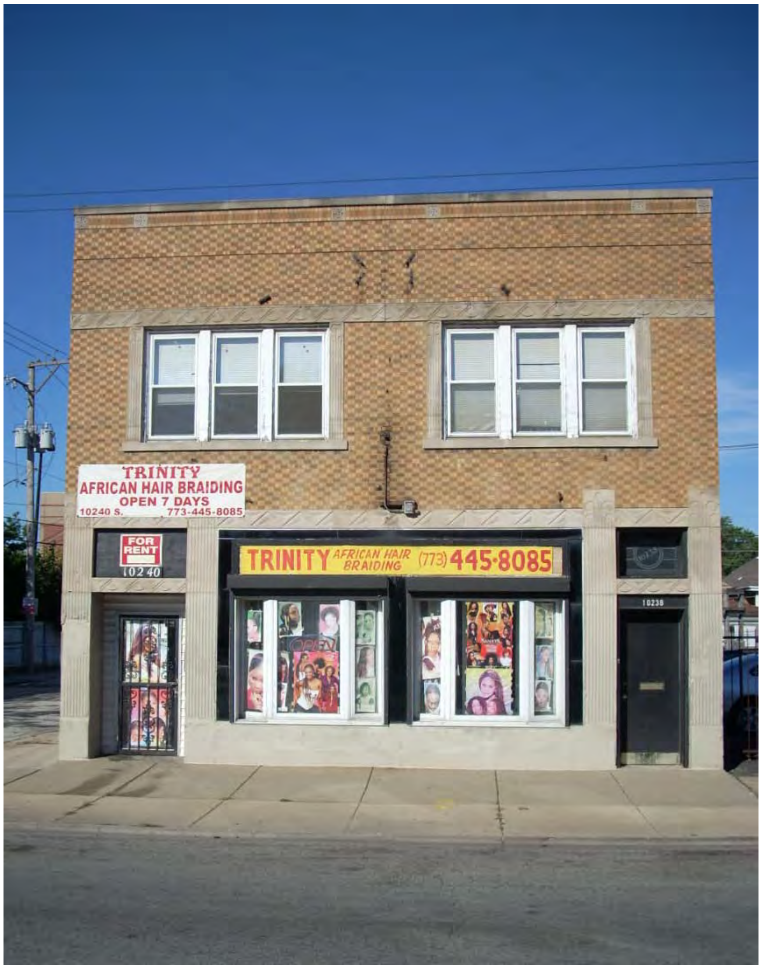
East façade of two-story, mixed-use, brick building.



Property Description: **Stories:** 2

This two-story, flat-roofed, mixed-use building in the Washington Heights community has a front façade clad with limestone on the first floor and light brown and orange-colored face brick above. The first floor has two non-original large central display windows and doors on either end. The second floor has two strips of three non-original one-over-one windows with stone casing. Art Deco detailing includes limestone banding with chevron and zigzag patterns on the first and second floors and fluted pilasters that terminate in scrolls flanking the two doors. This building does not feature sufficient distinguishing features to qualify eligible for individual listing on the National Register.

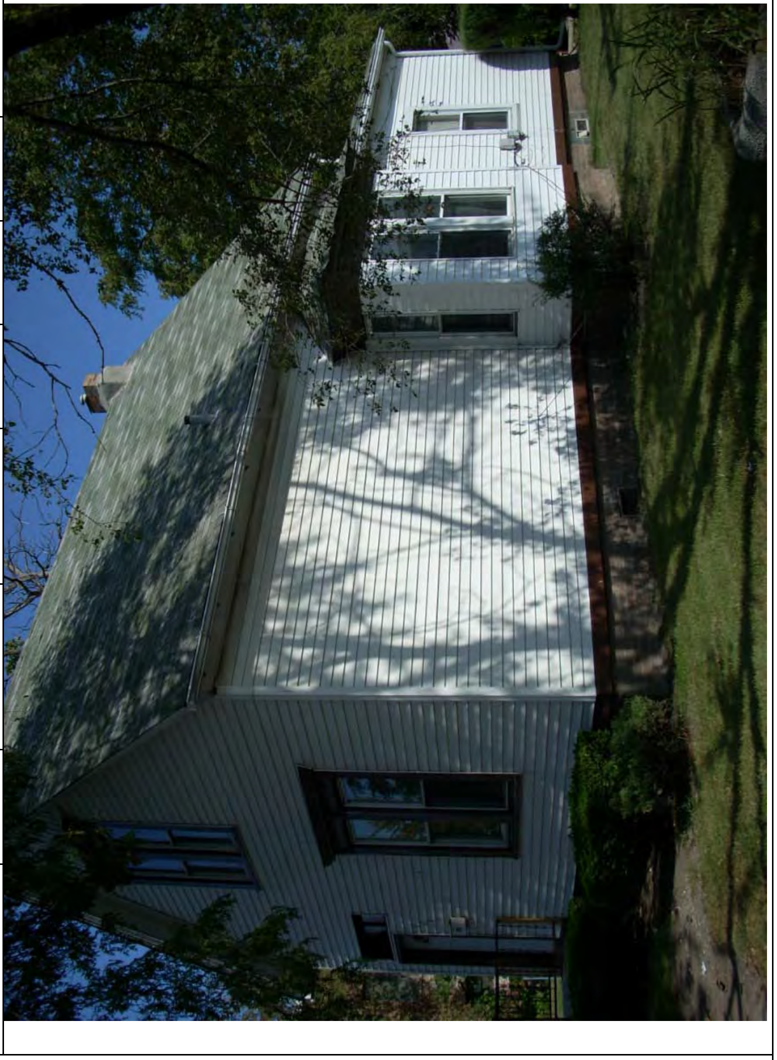
West and south façades of 1.5-story, single-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Washington Heights community is covered with synthetic siding and has a front gable roof covered with asphalt shingles. The front elevation has an off-center non-original hollow core metal door with a non-original horizontal window strip above; there are tall, paired, non-original one-over-one windows, each with a cornice, on the first floor and in the gable. New wood steps and metal rails provide access to the residence. The north elevation has a hip-roof three-sided window bay with double-hung, non-original aluminum sashes. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

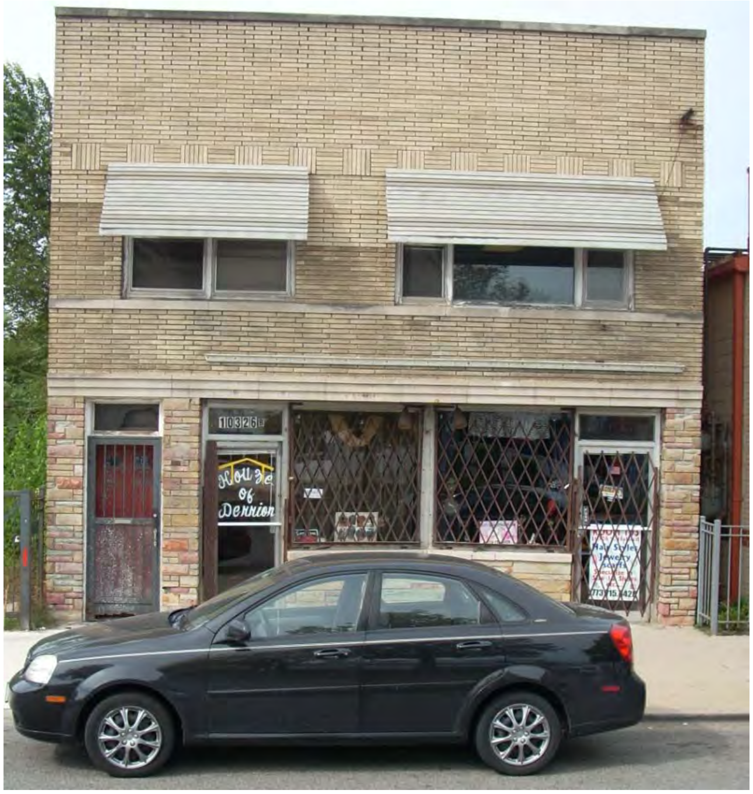
East façade of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story commercial building in the Washington Heights community has a flat roof and parapet with concrete coping. Its front elevation is covered with a stone veneer on the first floor and in patterned buff brick above. It has two storefronts with angled display windows flanked by plate glass doors with glass transoms. A third hollow core metal door with glass transom provides access to the second floor space. The second floor has two window groups: a pair of non-original one-over-one aluminum-sash windows and a non-original picture window flanked by one-over-one aluminum-sash windows, both of which are partially obscured by metal awnings. This building lacks distinctive architectural features and is not individually eligible for listing on the National Register.

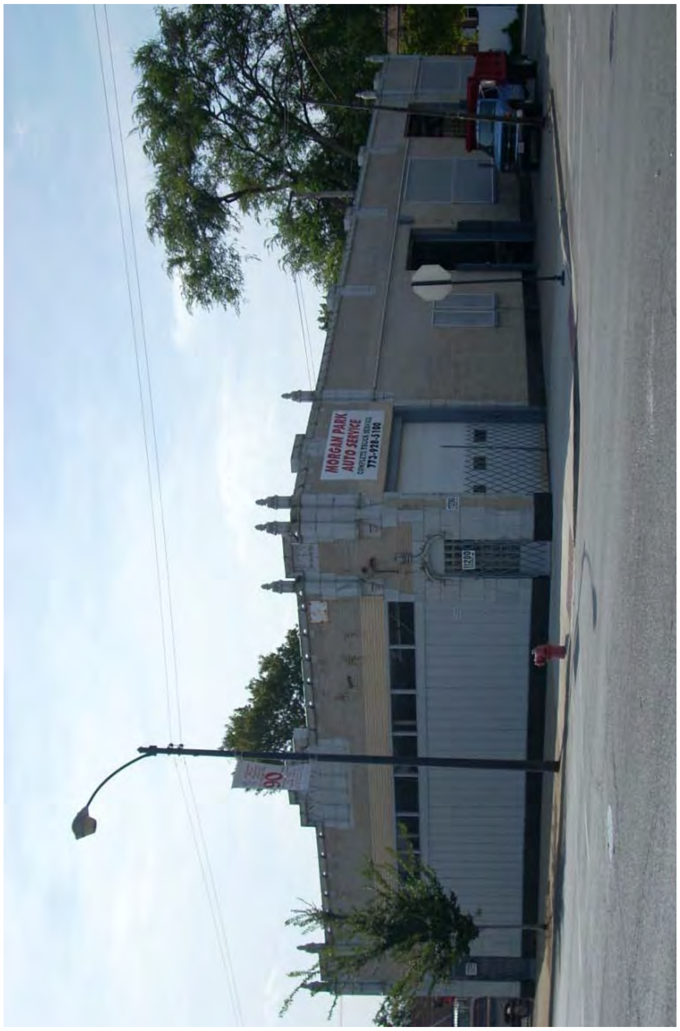
North and east façades of a brick, one-story, commercial building.



Property Description: **Stories:** 1

This one-story commercial building at the southwest corner of Halsted and 112th streets in the Morgan Park community is clad with yellow brick along its two street elevations. The building has a granite water table, a flat roof, and a crenellated parapet with terra cotta coping. The central section of the Halsted elevation is covered with wood boards laid vertically and spanned by a horizontal strip of rectangular single-pane windows. This elevation has doors on either end that are surrounded by cream-colored terra cotta and topped by ogee arches. The 112th Street elevation has three garage door openings and glass block windows. The storefronts have been completely altered and in-filled. Detailing includes terra cotta finals, decorative panels, and banding at the parapet level. This building lacks integrity and is not individually eligible for listing on the National Register.

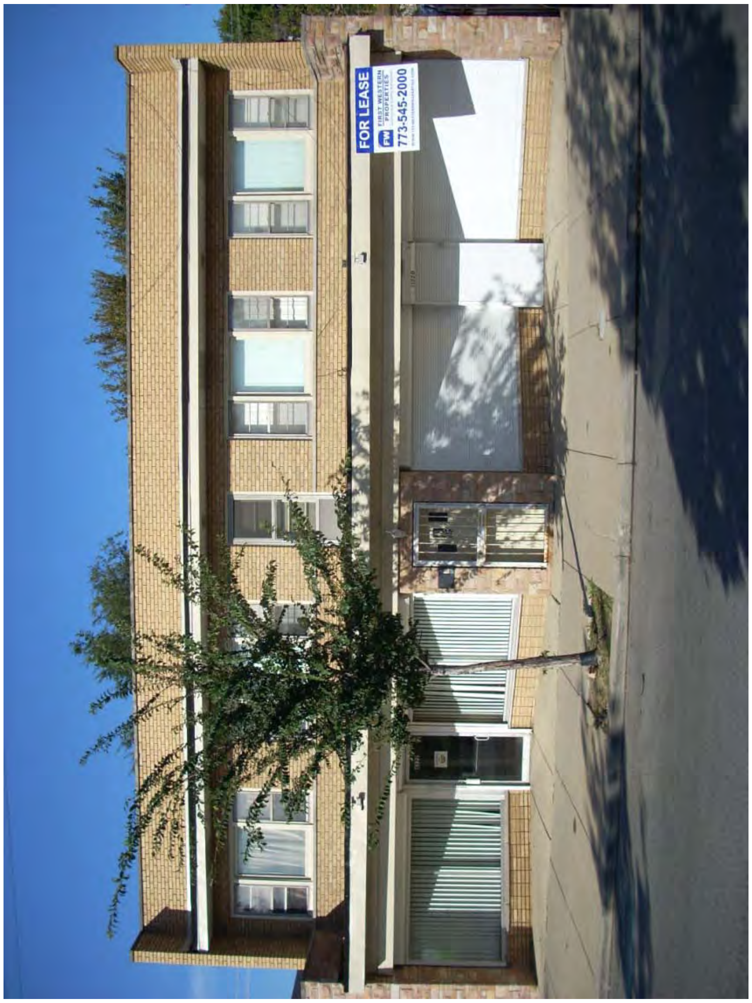
East façade of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story commercial building in the Morgan Park community has a flat roof, parapet, concrete banding, and projecting corner piers covered with faux stone on the first floor and yellow brick above. Its front elevation is clad with yellow face brick and has a central hollow core metal door flanked by two storefronts, each with central doors and angled display windows. The recessed second floor has a central door and four groups of windows, each of which is comprised of a picture window and flanking one-over-one aluminum-sash windows. Although an example of a Mid-Century Modern commercial building, it does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

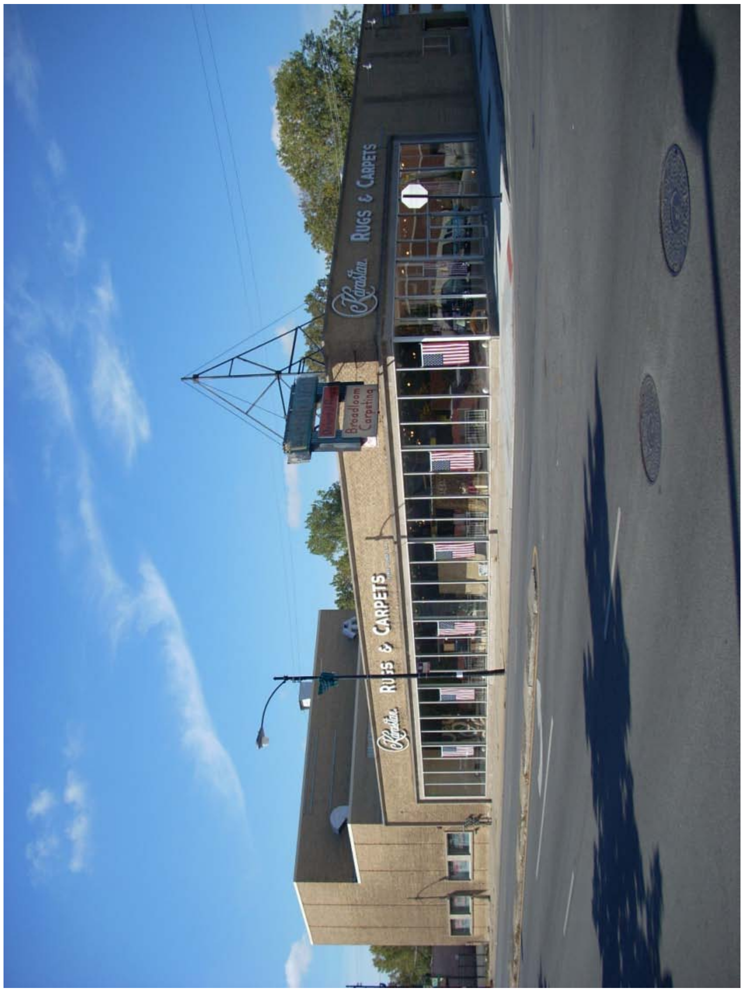
North and east façades of a brick, one-story, commercial building



Property Description: **Stories:** 1-2

This one-story retail commercial building at the corner of Halsted and 116th streets in the West Pullman community has a flat roof and parapet; it is clad with light brown face brick. The two street elevations feature a series of tall plate glass display windows that span nearly the entire length of the Halsted Street elevation. A two-story flat-roofed wing situated at the south end of its Halsted Street elevation is clad with the same light brown face brick and has four single-pane windows on the first floor. This building lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

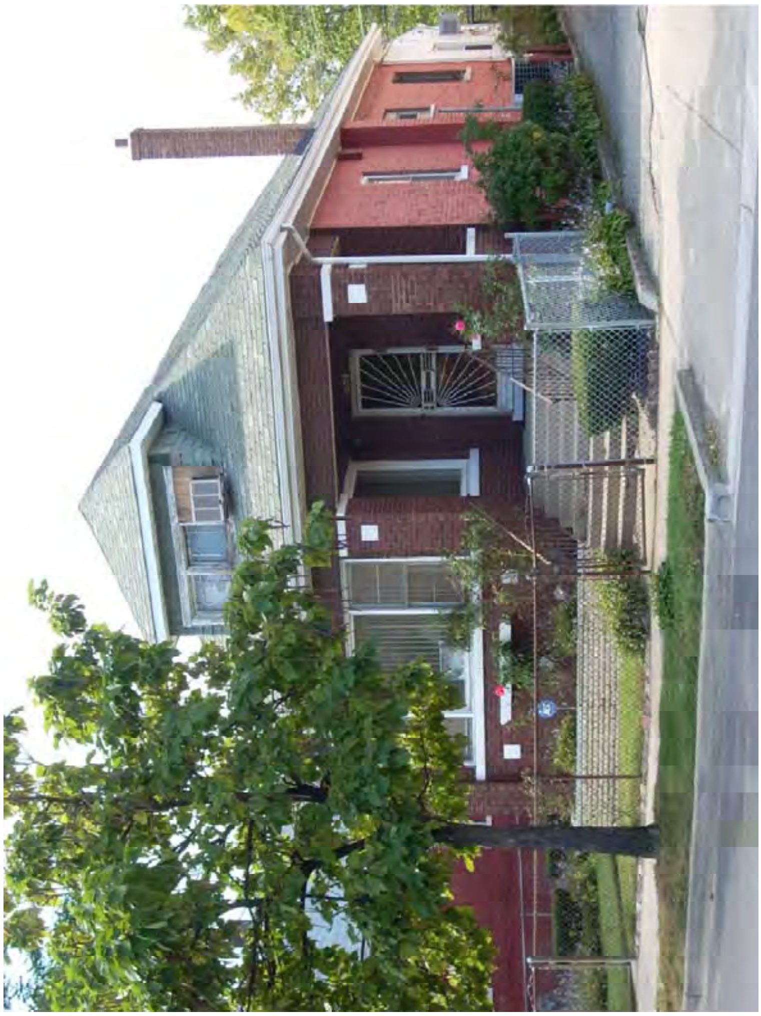
East façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story brick-clad bungalow in the West Pullman community is situated on a raised basement and has a hip roof covered with asphalt shingles, a hip dormer, and overhanging eaves. The front elevation has a recessed corner porch with a metal storm door, low brick sidewalls, a corner brick pier support, and concrete steps with metal railings. Windows on the front elevation include a non-original picture window flanked by one-over-one aluminum-sash windows in the living room bay, and a strip of three window openings in the dormer. The house has a synthetic-clad addition at the rear. Detailing includes square insert blocks used as decorative accents and concrete sills. This is an example of a Chicago bungalow, a building type that the City of Chicago has recognized through its Historic Chicago Bungalow Initiative. However, this house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

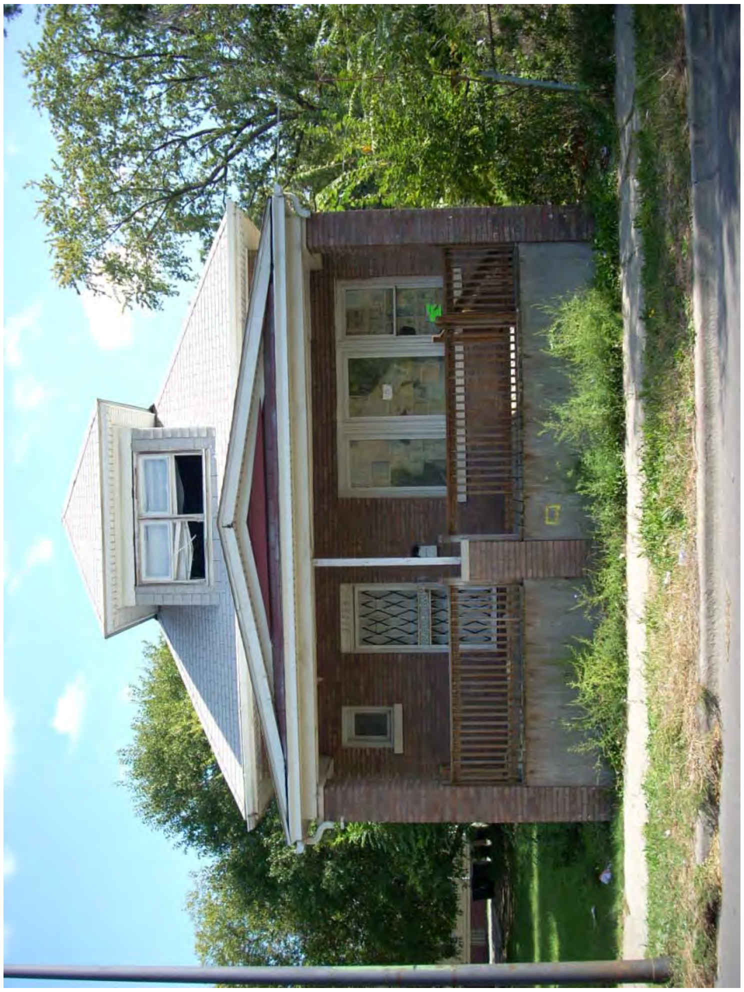
West façade of a one-story, single family, brick residence.



Property Description: **Stories:** 1

This vacant one-story brick-clad house in the West Pullman community is situated on a raised basement. The building has a hip roof covered with asphalt shingles, a hip dormer with a pair of window openings that only retain their upper sashes, and overhanging eaves. The front elevation has a full-width gabled wood porch with brick pier supports, an off-center hollow core metal door, a small casement window, and a strip of three non-original windows that include two with single panes and one that is double-hung. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

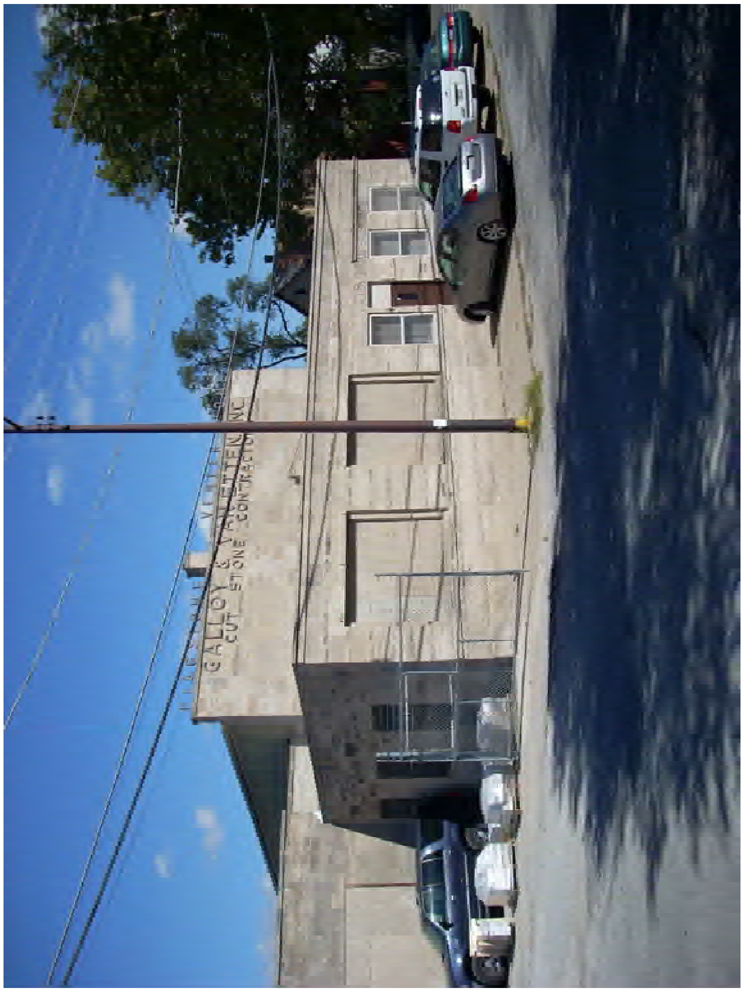
Photos with Captions:
South façade of a masonry, two-story, industrial building.



Property Description: **Stories:** 2

This two-story concrete block light industrial building in the West Pullman community has a one-story wing at its south end; both the main building and wing have flat roofs. A line of buttresses divide the building's long Halsted Street elevation into a series of thirteen bays; large windows have all been in-filled with synthetic materials. One of these bays features an overhead garage door. The front (south) elevation of the one-story office wing has a hollow core metal door with an in-filled transom, three non-original one-over-one aluminum-sash windows, and two large window openings in-filled with concrete block. An additional flat-roofed one-and-a-half-story wing is situated along the rear of the main building block. Its west elevation features a series of windows and overhead doors. Detailing includes concrete stringcourses and applied letters.

This industrial building is recommended for National Register listing under Criterion A for Industry. Dutch immigrant

Abram Van Etten and his partner George Galloy established the stone fabricating company in 1899. Located in a community that experienced a collapse of its industrial base in the 1970s and considerable disinvestment since that time, the building serves as an important, and rare, example of an early twentieth-century industrial building in West Pullman that retains its original use and ownership. It retains the majority of its original materials with the exception of fenestration along Halsted Street, where it appears that the windows have either been covered or removed.

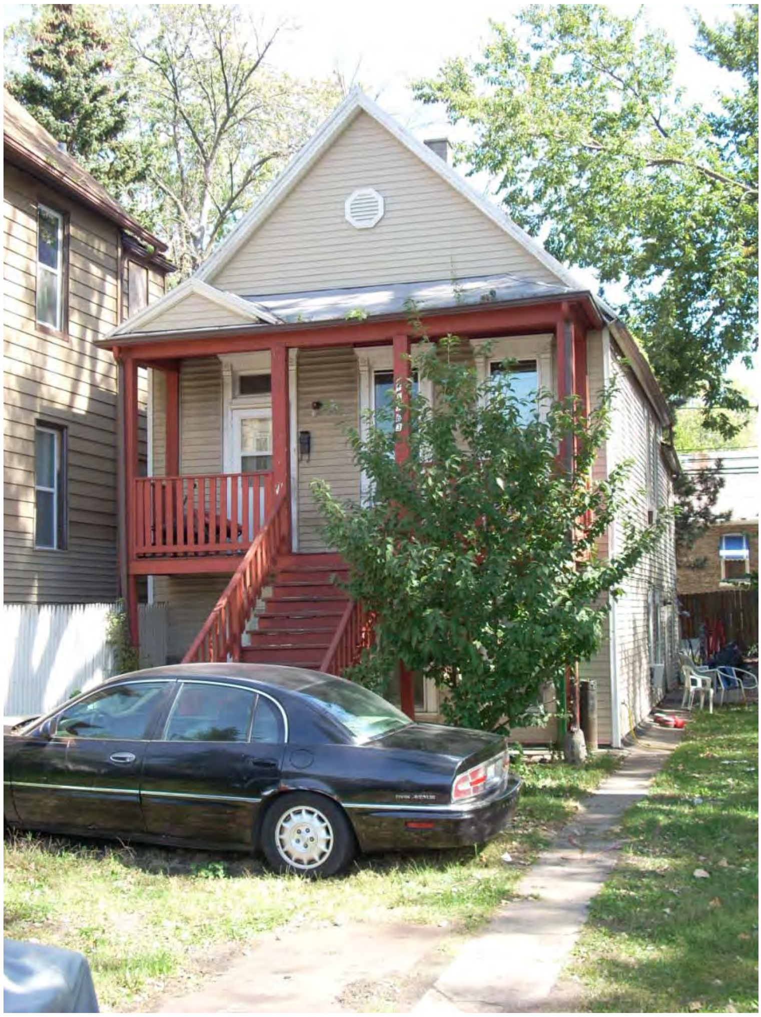
West façade of a one-story, multi-family residence.



Property Description: **Stories:** 1

This one-story frame house in the West Pullman community has a raised brick basement and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. Its front elevation has a full-width hip-roof wood porch that contains a gable accent above the door. The porch roof is supported with straight posts and railings, and an off-center door and two one-over-one windows on both the raised basement and the first floor levels. The first floor door has a transom: both the door and first floor windows retain their original wood casings with pilasters and cornices. An octagonal ventilating louver is situated in the gable. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

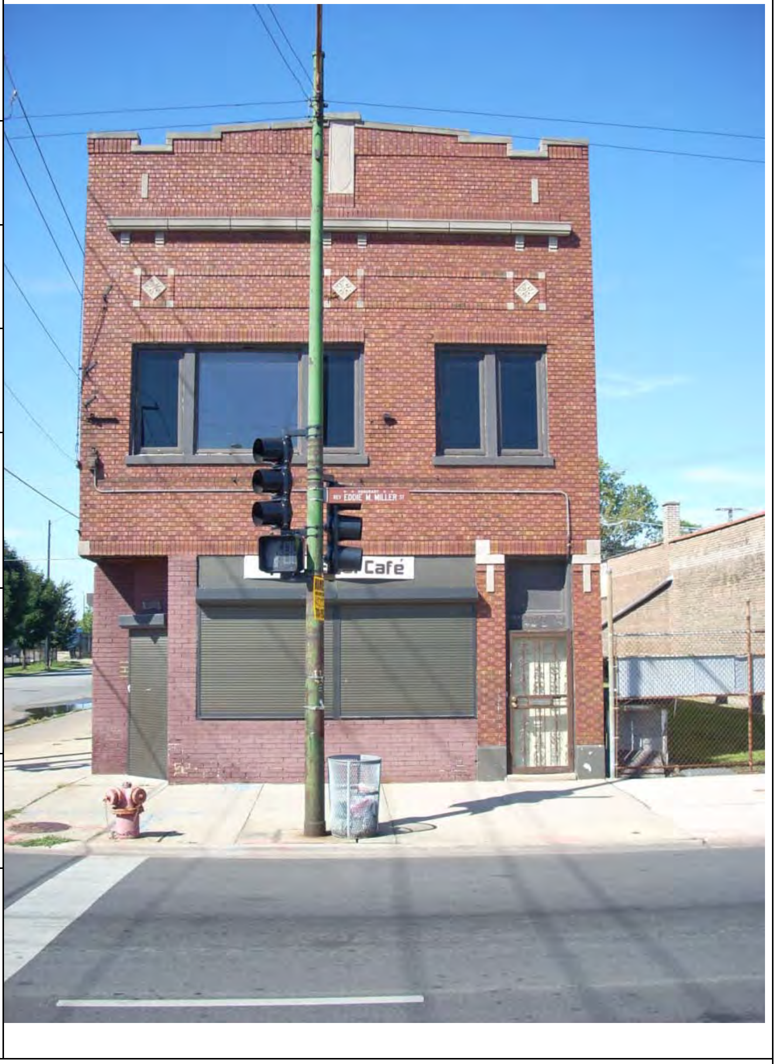
East façade of two-story, brick mixed-use building.



Property Description: **Stories:** 2

This two-story mixed-use building at the northwest corner of Halsted and 120th streets in the West Pullman community has a flat roof and shaped parapet with stone inserts and brick stringcourses. The building fabric at the street corner of the first floor has been removed so that the non-original corner door, which is covered in metal, is deeply recessed. A secondary entrance at the opposite end of the front elevation features a hollow core metal door and transom in-filled with wood and is flanked by original brown brick cladding. The remainder of the first floor along both street elevations features non-original brick cladding. The second floor of the front elevation features a large fixed-pane window flanked by casements and a separate pair of casements, all of which are non-original. Windows and door openings along the 120th Street elevation have been altered and the second floor of this elevation features a series of one-over-one windows. One of these windows is in-filled with glass block. This building does not feature sufficient integrity or distinguishing features to qualify as eligible for individual listing on the National Register.

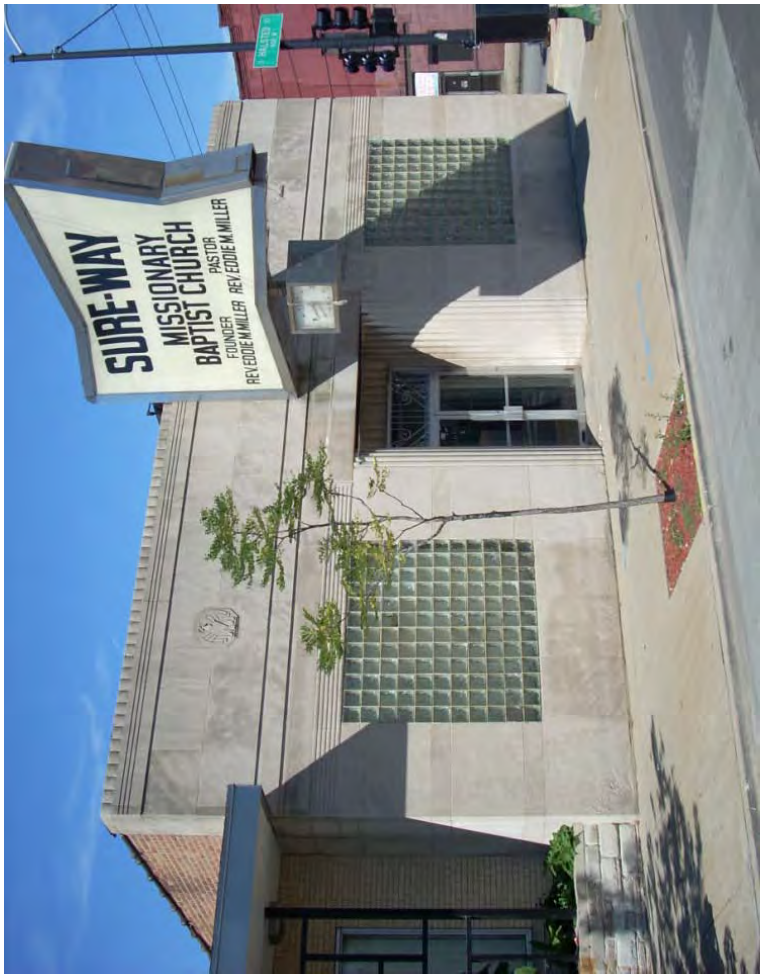
Photos with Captions:
East façade of one-story, masonry religious building.



Property Description: **Stories:** 1

This Art Deco style one-story church at the southwest corner of Halsted and 120th streets in the West Pullman community has a flat roof and parapet. Its front elevation is clad in smooth limestone and has a centrally located recessed entrance with glass double-doors, a transom, and fluted side walls. The entrance is flanked by two large glass block windows. Detailing includes two flattened stone reliefs featuring eagle motifs, dentils, and banding at the parapet level. A mid-century modern, one-story, flat-roofed wing clad in faux stone and buff brick is situated along the south side of the original building (bottom of photo). It features three large picture windows along its front elevation and wide roof overhangs.

This is a nice example of a stripped down Art Deco façade and a mid-century modern wing. However, the alternation of the two large window openings with glass block infill compromises the integrity of this small building, which no longer serves it original use. As a result, this building does not qualify as eligible for individual listing on the National Register.

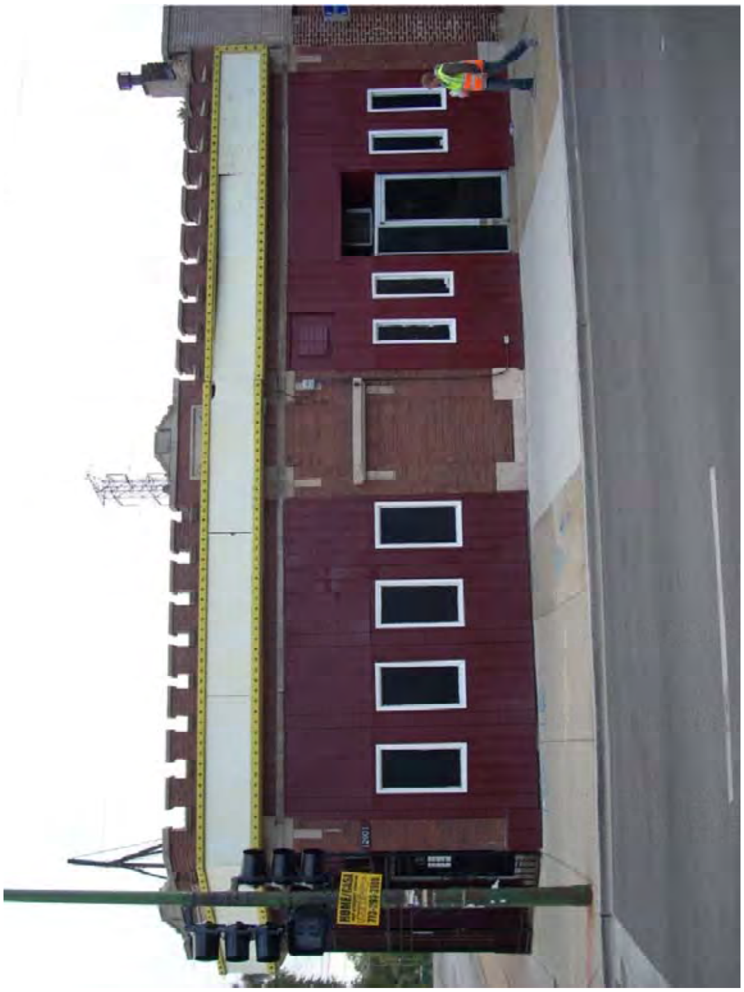
West façade of a one-story, brick, commercial building.



Property Description: **Stories:** 1

This one-story commercial building in the West Pullman community is clad with orange-brown face brick on its 120th Street elevation and synthetic siding on its Halsted elevation. The building has a flat roof and a crenellated parapet with concrete coping. The parapet is obscured by a continuous metal sign plate. The recessed corner entrance has a non-original plate glass door with an in-filled transom. The Halsted Street elevation has been altered with installation of a series of fixed-pane windows and an off-center glass door. However, this elevation retains four original brick piers with stone coping and geometric motifs as well as a portion of original brick cladding in the center, which includes a stone lintel above the outline of a former door opening now in-filled with brick. The 120th Street elevation includes two non-original doors, three double-hung wood-sash windows, and brick corbelling at the roofline. This building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

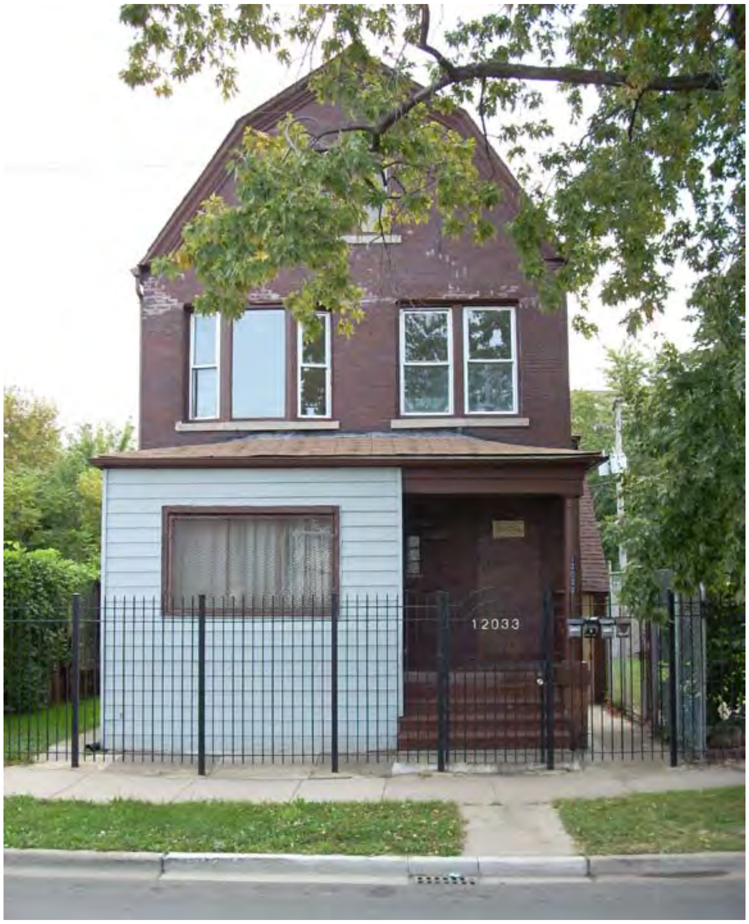
West façade of a brick, two-story, multi-family residence.



Property Description: **Stories:** 2

This two-story residence in the West Pullman community is situated on a raised basement and is clad with brown face brick on the front elevation and common brick on the side and rear elevations. The building has a gambrel roof covered with asphalt shingles. The front elevation has a full-width hip-roofed wood porch, one-half of which has been enclosed with synthetic siding and has a picture window. The open half of the porch has an off-center doorway that has been in-filled with brick, wood steps, and a corner tapered wood column at the corner. The entrance into the home is through the enclosed porch. The second floor of the front elevation has a bay with a picture window flanked by one-over-one aluminum-sash windows and a pair of one-over-one aluminum-sash windows. The attic level has a pair of windows. The side elevations feature one-over-one aluminum-sash windows of varying sizes and a small dormer. All windows are modern replacements. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

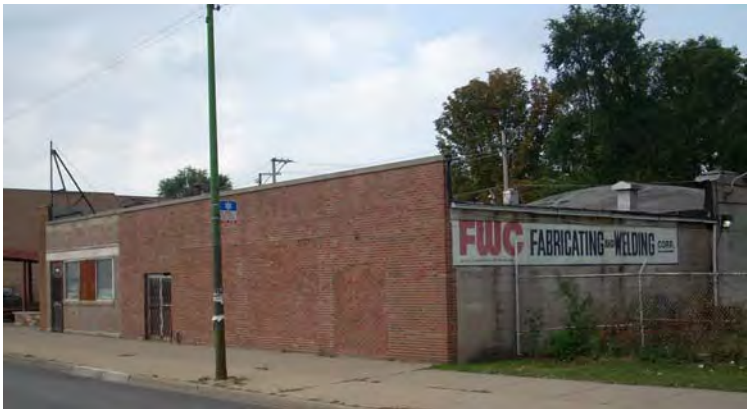
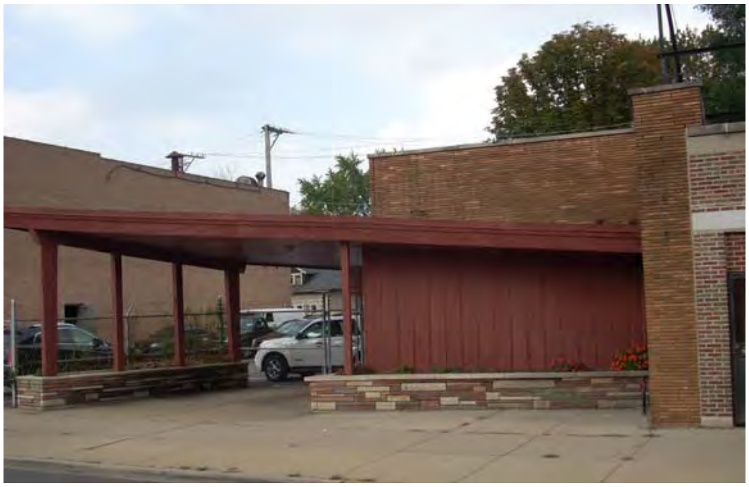
East and north façades of the one-story, brick, commercial buildings at 11212 (left) and 11216 (right).



East façade of the one-story, brick, commercial building at 11220.



Property Description: **Stories:** 1

This address consists of three commercial buildings in the West Pullman community that share common party walls. The 12212 building is a one-story, flat-roofed, concrete block building with brick laid in a running bond on its Halsted elevation; it features a pair of plate-glass double doors and the outlines of two former window openings and a door opening that have been in-filled with brick. The 12216 building is a one-story flat-roofed building with a brick front, an off-center door, a strip of three window openings (one in-filled and two fixed pane), and concrete banding above the windows and at the roofline. The 12220 building is a one-story flat-roofed building that is set back from the sidewalk; it has a south-facing front elevation with a pair of plate-glass double doors and a Mid-Century modern shed-roofed canopy supported by wood posts embedded in faux stone planters. The lower portion of 12220's east (Halsted) and south elevations are faced with wood boards that are vertically laid. These buildings lack distinctive architectural features and are not individually eligible for listing on the National Register.

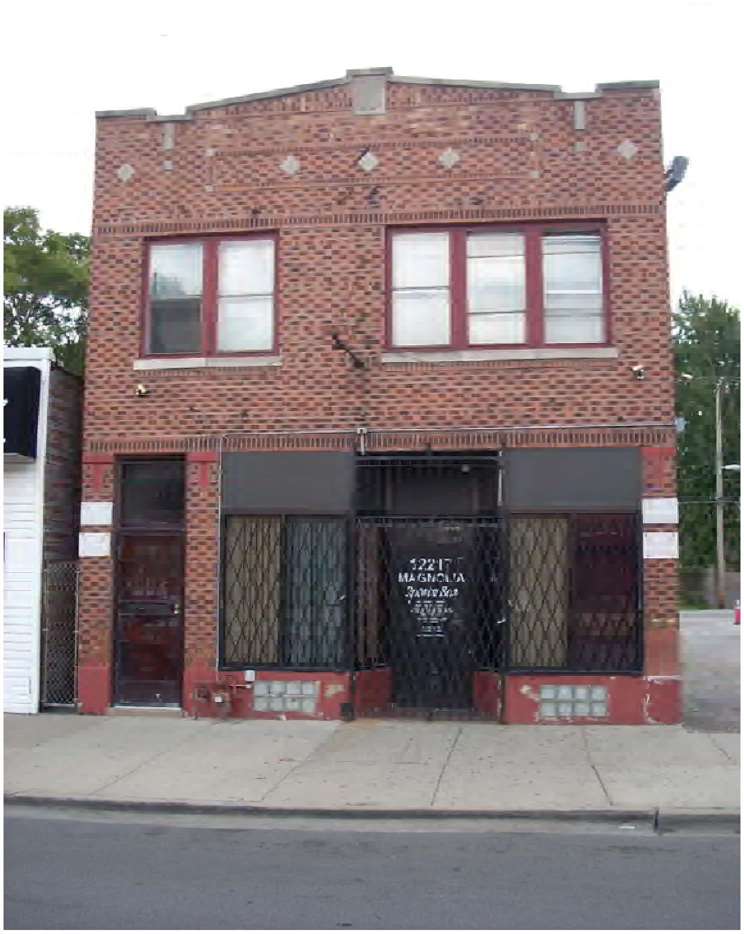
West façade of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story mixed-use building in the West Pullman neighborhood is clad with multi-colored face brick (laid in a pattern) on the front elevation and common brick along the side and rear elevations. The building has a flat roof and shaped parapet. The front elevation has a concrete water table with decorative glass blocks, a storefront with recessed central entrance and flanking display windows, and an off-center door that provides access to the second floor. Transoms above storefront windows and the off-center entry have been in-filled. Second floor windows include five non-original one-over-one aluminum-sash windows arranged in a pair and in a group of three. Detailing includes insert blocks, a concrete panel with shield motif, coping, brick stringcourse, brick recessed panel, and concrete sills. Additional detailing includes concrete inserts along the storefront façade. This building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

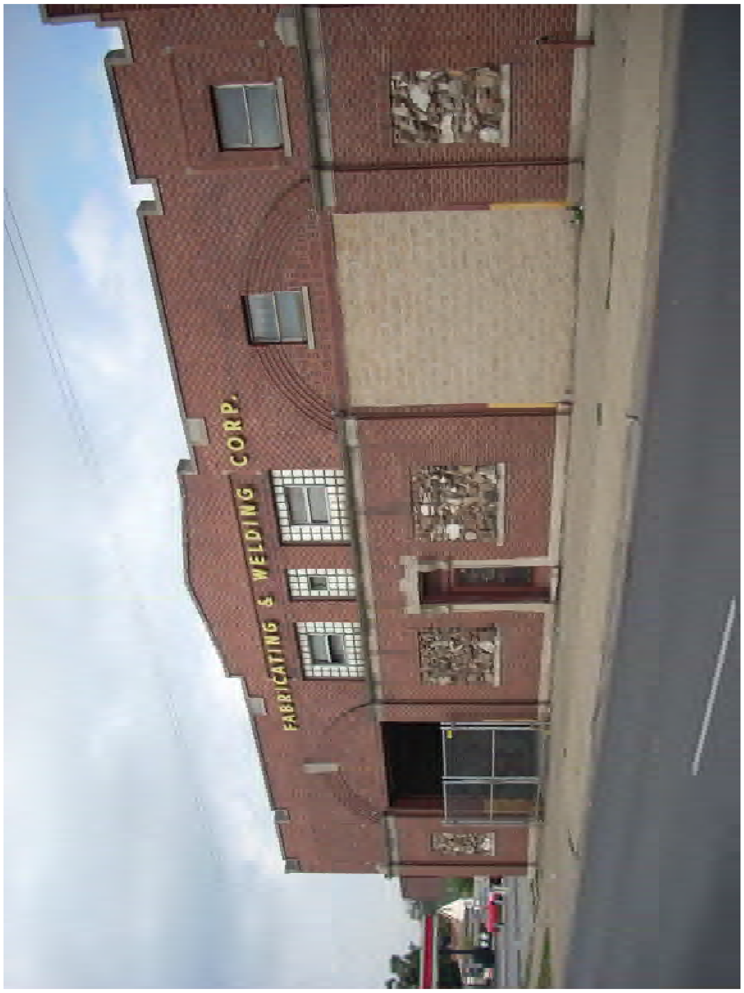
East façade of a brick, two-story, industrial building.



Property Description: **Stories:** 2

The industrial building in the West Pullman community is clad with face brick along the Halsted elevation. It features a shaped parapet, symmetrical façade, and central entrance with a concrete surround featuring scrolled brackets and a lintel with curvilinear motifs. The building includes two garage door openings with brick arches and stone keystones; one of the garage bays is in-filled with concrete block. Detailing includes four brick pilasters, a concrete belt course, concrete panels, a brick arch with keystone spanning the width of the garage door opening, and concrete coping and sills. Former window openings on the first floor are in-filled with decorative stone. Three of the five second-floor window openings are in-filled with glass block, two are double-hung aluminum sash. This building lacks integrity and is not individually eligible for listing on the National Register.

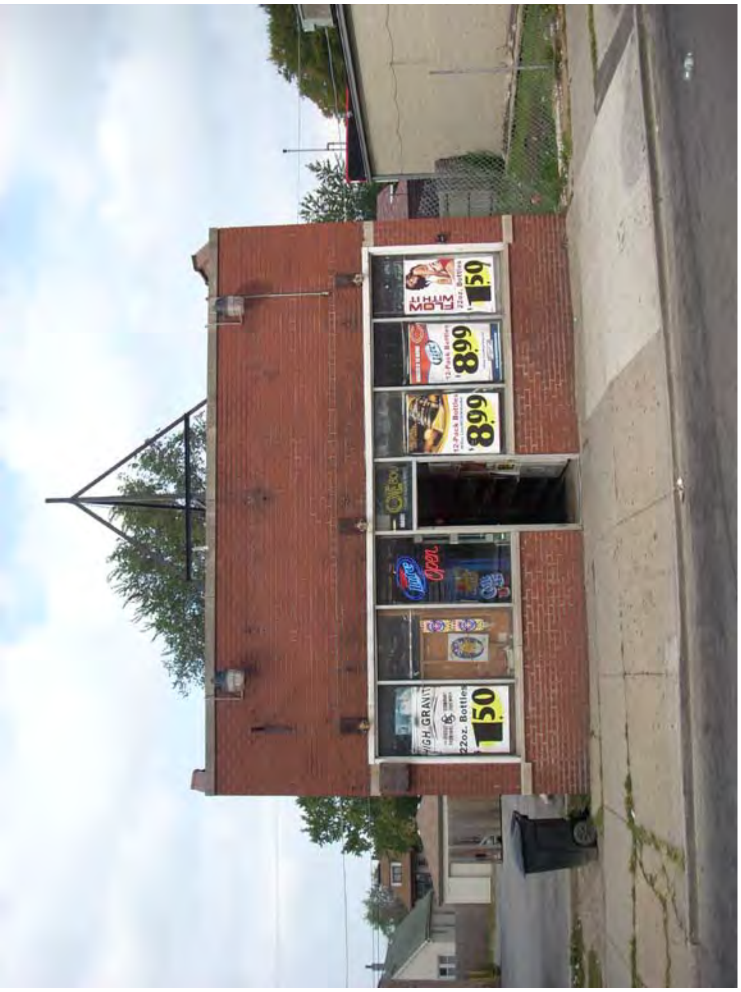
East façade of a brick, one-story, commercial building.



Property Description: **Stories:** 1

This one-story, flat-roofed, commercial building in Calumet Park is clad with orange face brick along its Halsted Street elevation and with common brick along its side and rear elevations. Its front elevation has a central plate glass door flanked by strips of three single-pane windows on either side. Detailing is limited to concrete coping, sills, and inserts blocks. Brackets and shadows on the façade suggest that a sign plate has been removed. This building lacks distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story bowling alley at the northeast corner of Halsted and 124th streets in the West Pullman community has a flat roof with a shallow domed area on its north side. Both street elevations are clad with alternating bands of yellow and orange colored face brick and are largely unadorned, except for the south end of the Halsted Street elevation, which is clad with a stone veneer and has glass double-doors and three double-hung windows. The stone veneer turns the corner to cover a small portion of the 124th Street elevation, which is pierced by an in-filled window opening. This building lacks distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1.5

This one-and-a-half-story frame cottage in Calumet Park is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles and shed dormers along its side elevations. The front elevation has a full-width, hip-roof wood porch with supports made of faux stone piers topped by squat boxed columns. The porch shelters an off-center door and three non-original one-over-one aluminum-sash windows. There are two non-original one-over-one aluminum-sash windows in the gable. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

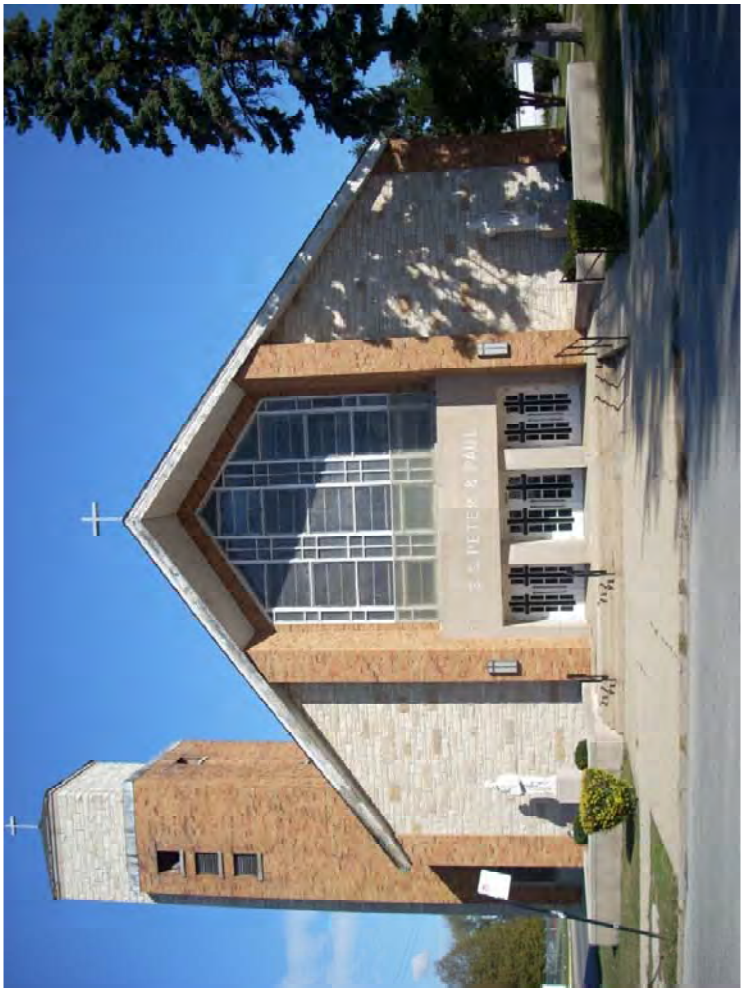
South façade of brick, one-story, religious building.



Property Description: **Stories:** 1

This Mid-Century Modern church at the northeast corner of Halsted and 125th streets in the West Pullman community was built for the parish of Saints Peter and Paul. The church is clad with orange face brick and stone veneer, has a steeply pitched front gable roof, deep roof overhangs along the front elevation, and a square hip-roof corner tower with a vertical strip of leaded glass windows. The front elevation has a central pavilion flanked by projecting full-height brick piers, three sets of original double doors divided by concrete piers and topped with a concrete spandrel with incised lettering that reads “S.S. Peter and Paul,” and features an expansive area above which is glazed with leaded glass. The side elevations feature a series of narrow windows that appear to be double-hung. This building is recommended as individually eligible for National Register listing under Criterion C for architecture as an excellent and rare example of a Mid-Century Modern church in West Pullman.

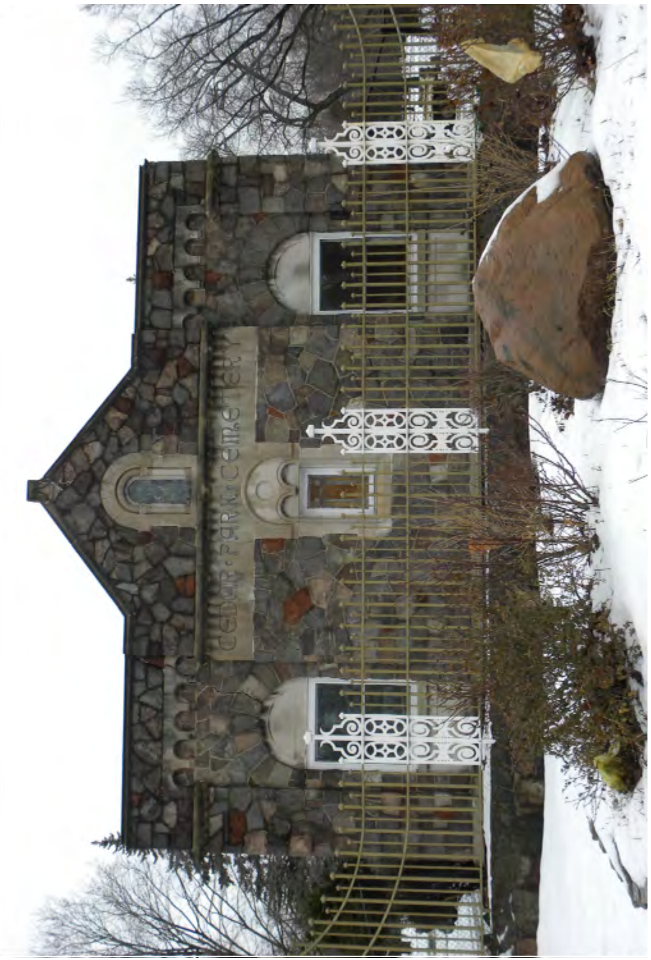
Photos with Captions:
East façade of cemetery entrance showing office/gatehouse.



Property Description: **Stories:** 1

Cedar Park Cemetery, founded in the early twentieth century, comprises a formal landscape on 94.5 acres at 12540 S. Halsted Street. Plantings include large deciduous shade trees as well as ornamental shrubs and mowed lawn. Grave markers are mounted flush with the lawn. The landscape is not exceptional nor does it contain any distinctive design features and does not warrant listing on the National Register of Historic Places.

Extant buildings and structures include the office/gatehouse with ornamental gate and fence, an obelisk, three mausoleums, and a cinder block building. Cedar Park Cemetery's one-story Romanesque Revival style gatehouse is located at its Halsted Street entrance. The entrance features two pairs of massive stone gateposts and metal entrance gates. Original metal fencing extends along the length of the cemetery's Halsted Street boundary, which also features several stone piers. The gatehouse, gateposts, and piers are built of grey, brown, and pink stones that are randomly laid. The building and piers have excellent integrity and were likely installed circa 1923, along with the metal entrance gates and fencing along Halsted Street, when the Cedar Park Cemetery Association purchased its original 53-acre site. The building, piers, and gates are locally eligible for National Register listing under Criterion C for architecture due to their high quality craftsmanship and unusual stonework.

The gatehouse has a flat roof, parapet, and stone cornice. All windows have stone sills and stone lintels with a type of scallop shell motif. The Halsted Street elevation has four windows: a small stained glass window in its projecting bay, a single window with round-arched transoms on either side of the bay, and a small, round-arched window flanked by slender colonettes in the parapet gable. The Halsted elevation bay is topped with stone banding incised with the words “Cedar Park Cemetery.” The north elevation has a centrally located pair of wood French doors and six wood-sash windows: three each on either side of the entrance. The south elevation has a centrally located multi-paned wood door with sidelights flanked by slender engaged columns. The south elevation’s four windows include a single one-over-one window on one side of the door and a group of three windows—a single pane flanked by one-over-one windows—on the other. Doors on both the north and south elevations are topped by flat stone lintels and accessed via concrete steps flanked by stone piers. The rear elevation has five one-over-one windows: a single, centrally-located window with a pair of windows on either side.

The three granite-clad mausoleums (the location of one is obscured by trees) appear to date from the middle to late twentieth-century. One of them features a chapel, which hosts non-denominational funeral services. The cinder block building, accessed by a secondary entrance just north of 125th Street, is utilitarian in nature and may serve as a maintenance building and/or as a crematorium. Neither the mausoleums nor the cinder block building appear to be eligible for inclusion on the National Register of Historic Places.

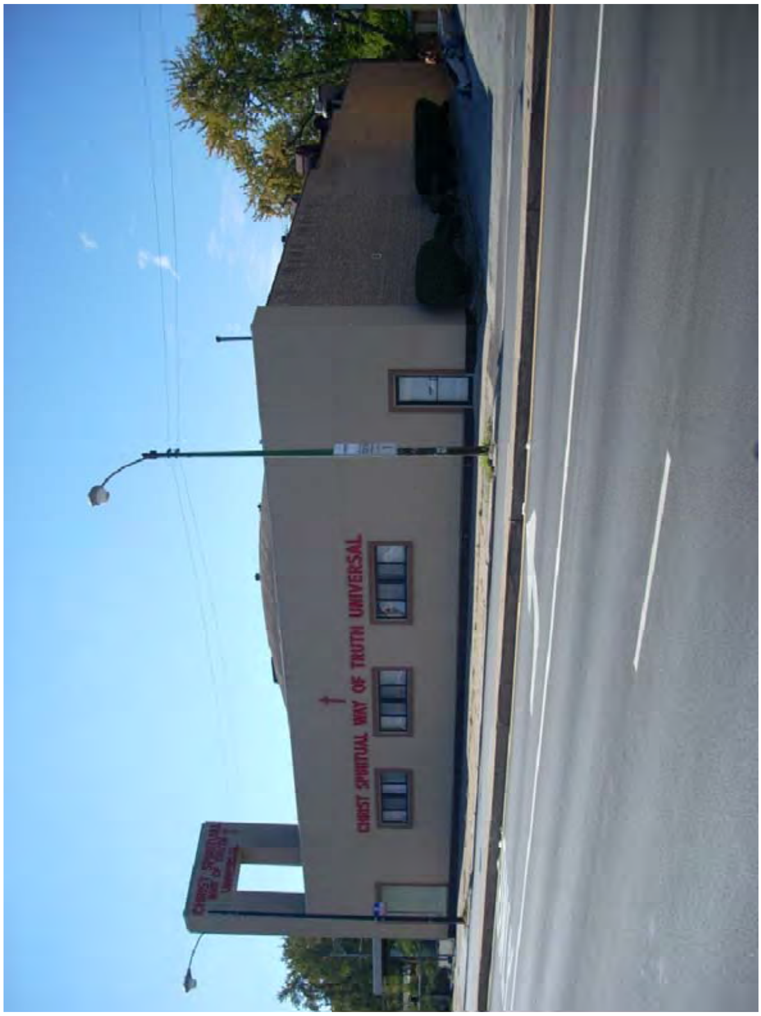
North and east façades of a one-story, brick religious building.



Property Description: **Stories:** 1

This one-story brick-clad church building in the West Pullman community has a roof that is mainly flat with a shallow domed area and is covered with a smooth material that appears to be shotcrete along its east (Halsted) and south elevations. The Halsted elevation has three strips of four single-pane windows, a plate glass door at its north end, and a large single-pane window at its south end. The building's front entrance is along the south elevation, facing its parking lot, and has a pair of double doors at its east end that are sheltered by a flat-roofed metal canopy supported by two metal posts. A tall sign that signified the church's name is situated at the southeast corner of the building. This building does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

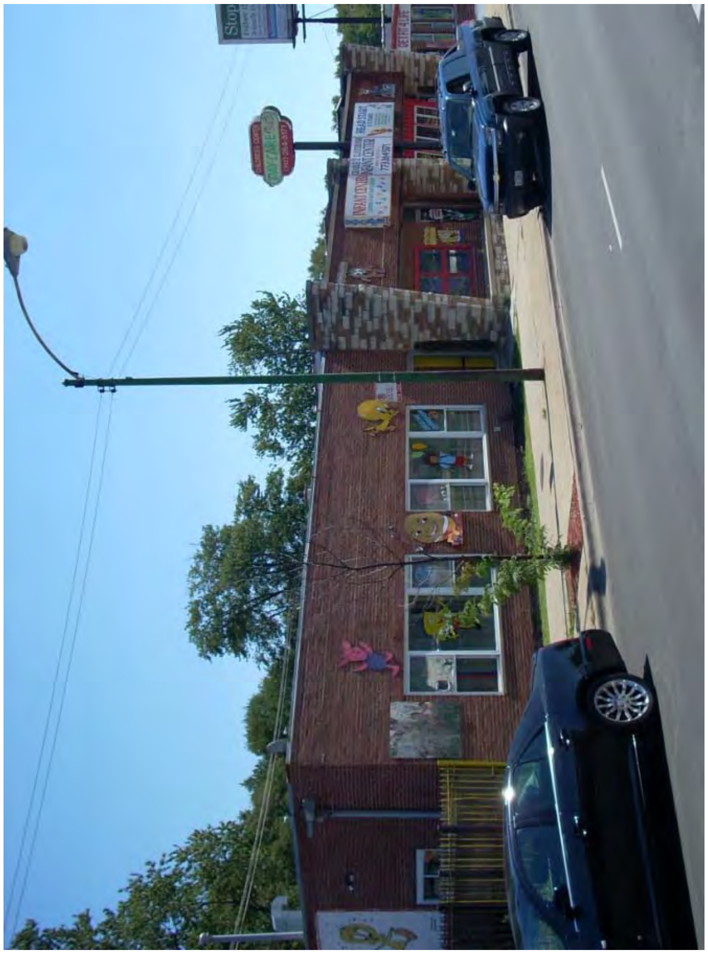
West façade of one-story, brick commercial building.



Property Description: **Stories:** 1

This one-story brick-clad building in the West Pullman community, which accommodates a day care center, has a flat roof and parapet. Its front elevation features faux stone piers, three of which are projecting and rise above the roofline, dividing the front (Halsted) elevation into five bays that feature glass doors and fenestration that includes picture windows and double-hung windows of varying shapes and sizes. This building does not feature distinguishing architectural elements to qualify as eligible for individual listing on the National Register.

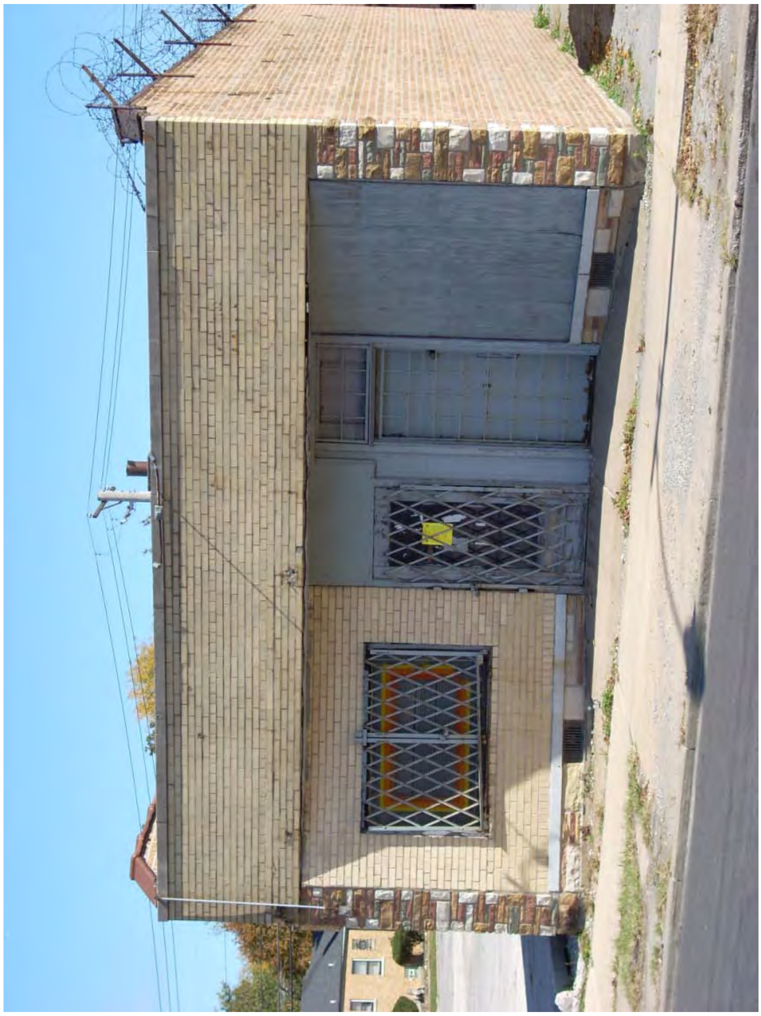
West façade of a one-story, brick, commercial building.



Property Description: **Stories:** 1

This one-story commercial building in the West Pullman community has a flat roof and parapet. The front elevation has a buff brick parapet, corner piers clad with a stone veneer, and two central doors with in-filled transoms. One of its former display windows has been in-filled with wood boards while the other has been in-filled with buff brick and a rectangular window. The side and rear elevations are clad with common brick. This building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

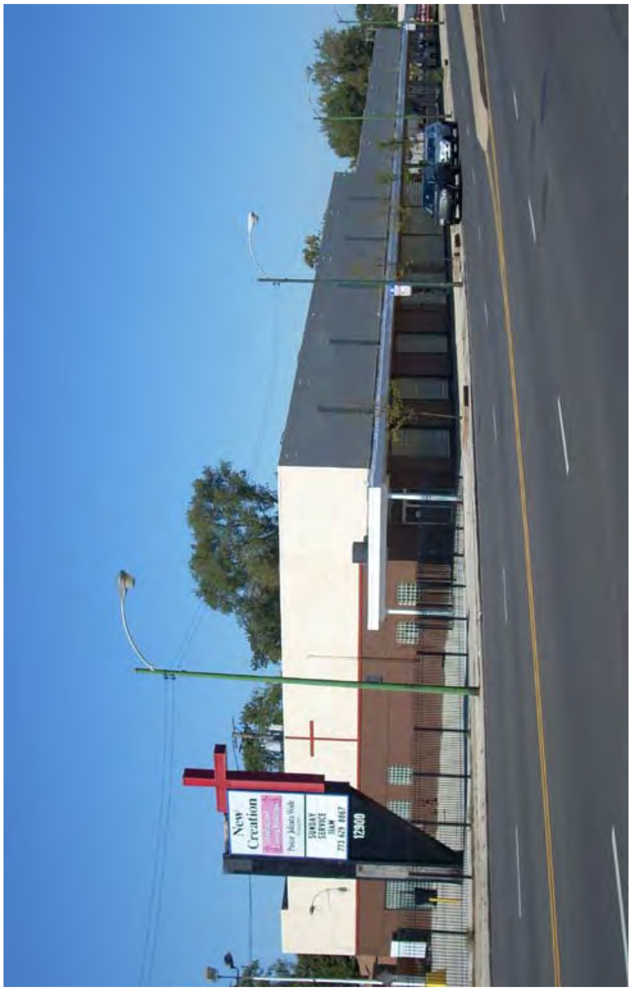
North and east façades of a two-story, brick religious building.



Property Description: **Stories:** 2

This expansive two-story, flat-roofed, brick-clad building has a one-story wing to the north. The building appears to have been built as a chain store or supermarket, but now serves as a church. A flat-roofed canopy extends along the entire length of the building's front (Halsted) elevation and shelters a pair of plate glass double-doors with transom and a continuous series of nearly floor-to-ceiling window openings that are in-filled with glass blocks and separated by wood cladding that is vertically laid. The second floor of the front elevation's two-story block has a series of narrow glass block windows. The front elevation of the one-story north wing is clad with wood that is vertically laid and a pair of wood double-doors but no windows. The building's south elevation has a pair of plate-glass double-doors with transom at its eastern end and a series of glass block windows. It does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

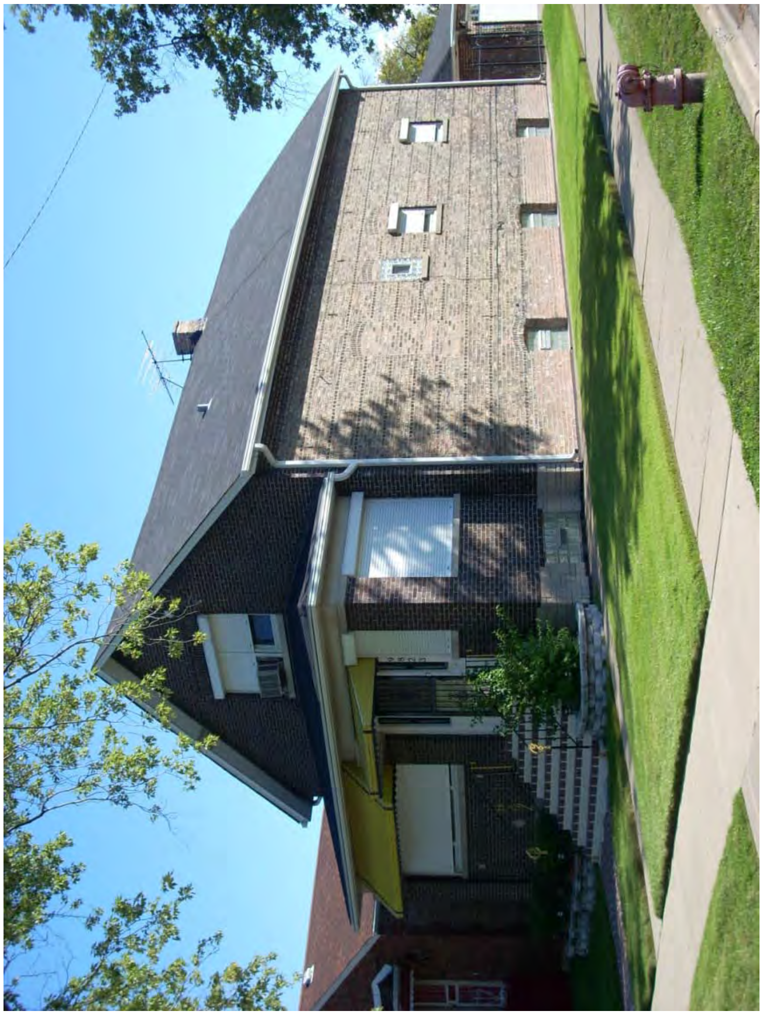
East and north façades, of 1.5-story, single family, brick residence.



Property Description: **Stories:** 1.5

This 1.5-story home in the Roseland community is situated on a raised brick basement with glass block windows and has a front gable roof covered with asphalt shingles. Its front elevation is clad with brown face brick, as is its enclosed, full-width, hip roof porch that has concrete lintels and sills. The front elevation has an off-center door with sidelights, metal steps and railings, and two first-floor window groups that are covered with metal screens, as were the paired windows in the gable. Some windows on the side elevation are in-filled with brick and glass block. This home lacks integrity and does not feature sufficient distinguishing features to qualify as eligible for individual listing on the National Register.

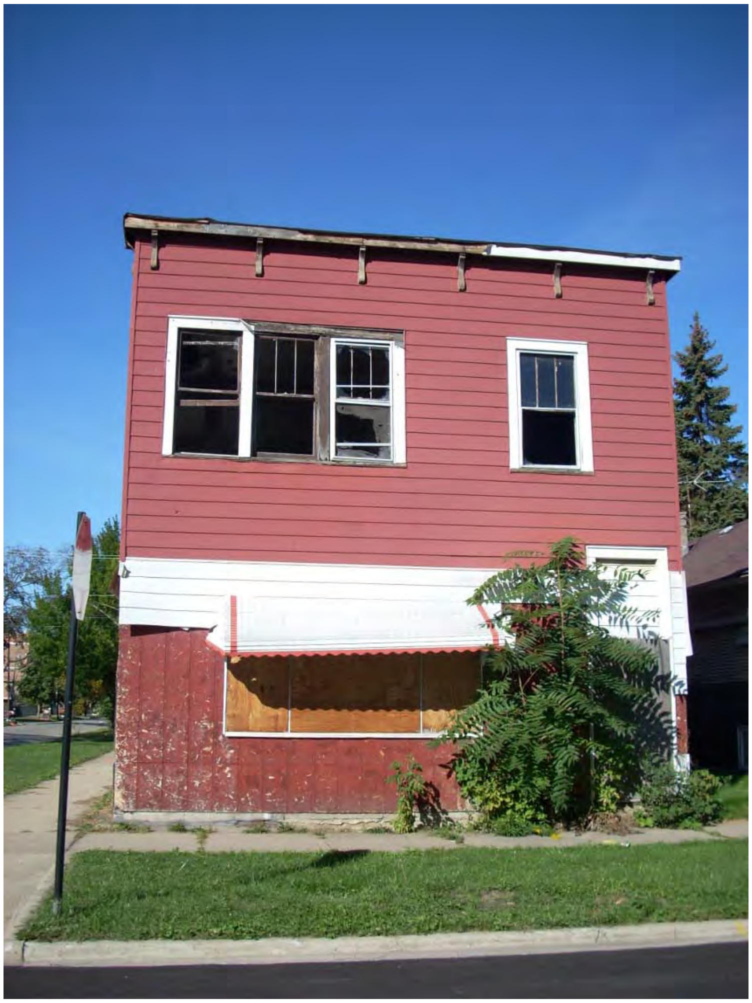
East façade of a two-story, multi-family, frame residence.



Property Description: **Stories:** 2

This two-story building at the northwest corner of Harvard Avenue and 114th Street in the Roseland community is clad with wood board vertically laid on the first floor and with synthetic siding on the second floor. The building has a flat roof and parapet. The front (Harvard Avenue) elevation has an off-center door and a group of three first floor windows that have been covered with plywood and are sheltered by a metal awning. The second floor of the front elevation has four windows—a group of three and a single window—that were formerly three-over-one wood-sash, although most of the glass panes are now gone. The front elevation is topped by a bracketed unadorned wood cornice. The windows on the 114th Street elevation have been covered with plywood on the first floor and have missing glass panes on the second floor. This former commercial building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

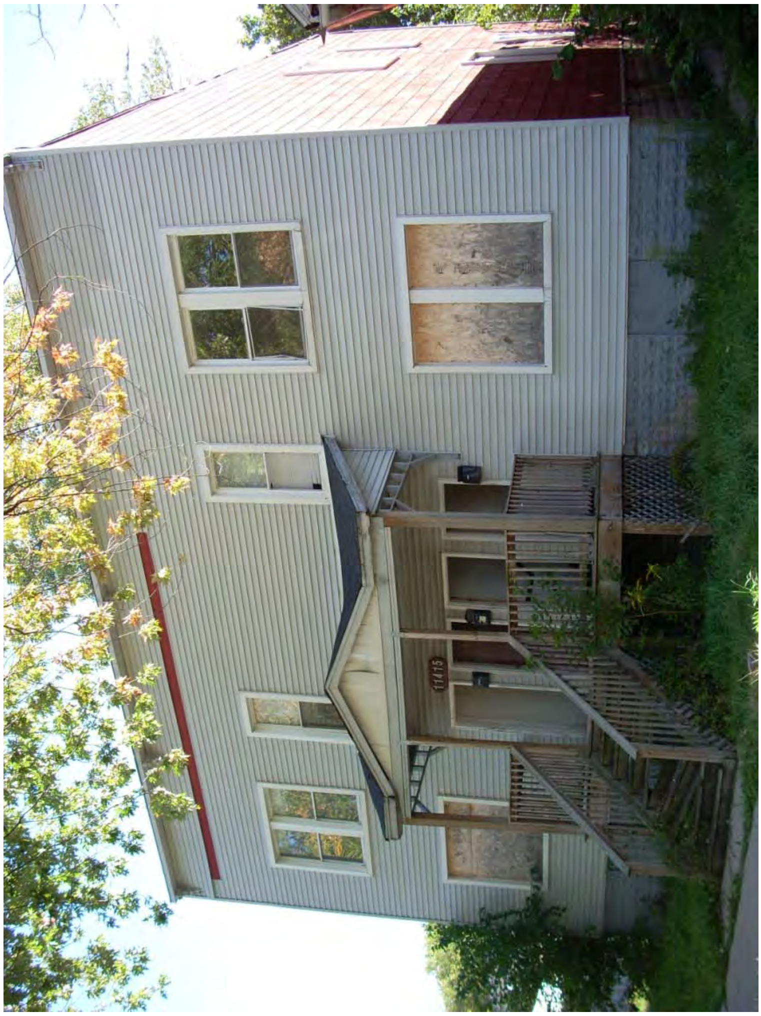
West façade of a two-story, four-flat, frame residence.



Property Description: **Stories:** 2

This two-story four-flat building in the Roseland community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a flat roof and parapet. Its front elevation has four centrally located doorways that lack doors, a partial-width wood porch with a gable-on-shed roof, non-original straight posts and railings. There are two window groups on the first floor that are covered with plywood and six non-original one-over-one aluminum-sash windows on the second floor. The parapet level features a bracketed unadorned cornice. This building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

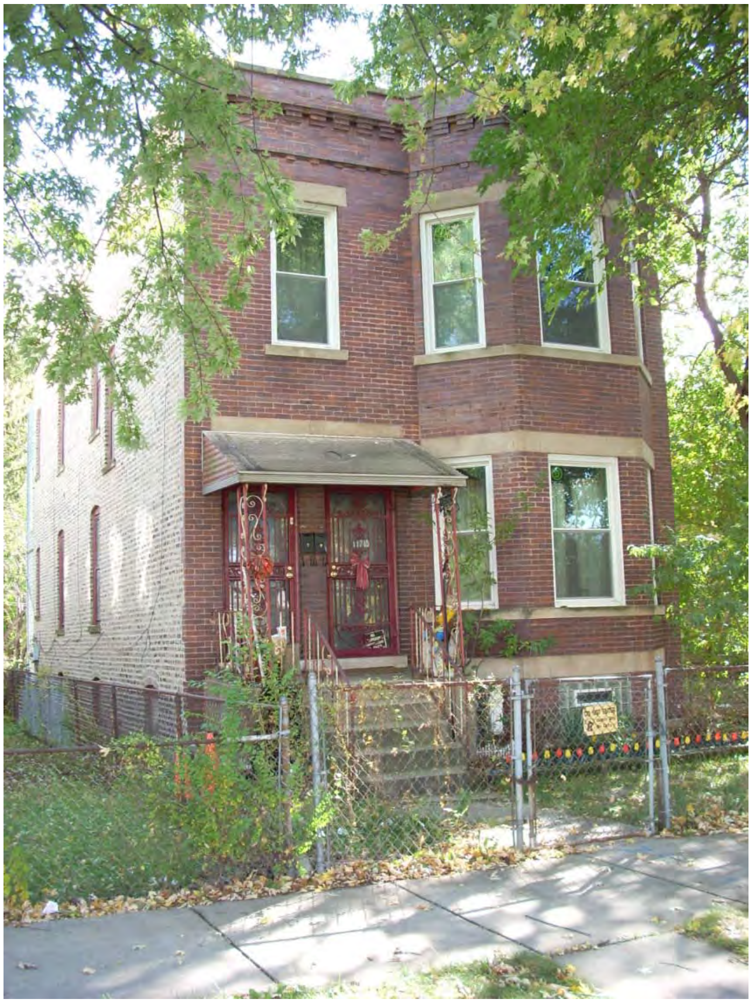
West façade of a brick, two-story, multi-family residence.



Property Description: **Stories:** 2

This two-flat, multi-family residential building in the West Pullman community is situated on a raised basement with glass block windows and is clad with face brick on the front elevation and common brick on the side and rear elevations. The building has a full-height window bay pavilion, a flat roof, and parapet. The front elevation has a partial-width porch with concrete steps and open metal posts supporting a metal shed-roof. A pair of off-center storm doors is located under the porch roof. There are seven non-original one-over-one windows: three on the first floor bay and four on the second floor, including three on its window bay. Detailing includes concrete sills, belt courses, brick cornice with corbelling, and brick dentils. This building lacks distinctive architectural features and is not individually eligible for listing on the National Register.

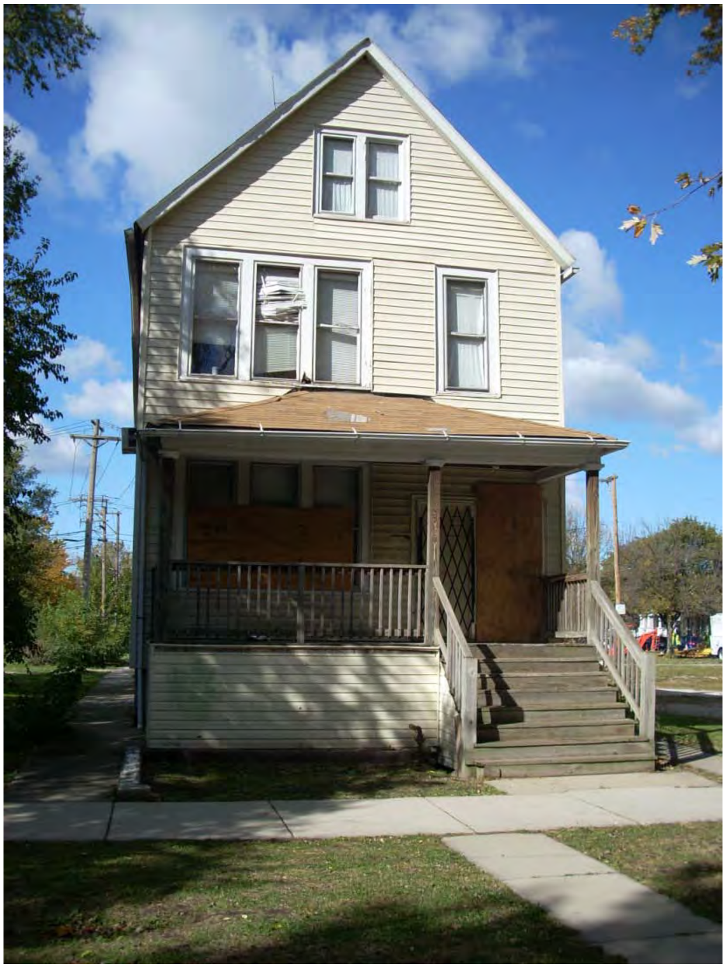
East façade of a two-story, single family, frame residence.



Property Description: **Stories:** 2

This two-story frame house in the West Pullman community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof covered with what appears to be roofing paper. The front elevation has a full-width, hip-roof, wood porch with a synthetic-clad base, straight wood railings and posts, and an off-center door. A group of three windows on the first floor are partially obscured by plywood. There are four windows on the second floor (three of which are grouped together) and a pair of windows in the gable. Above the basement, windows are non-original one-over-one aluminum-sash. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

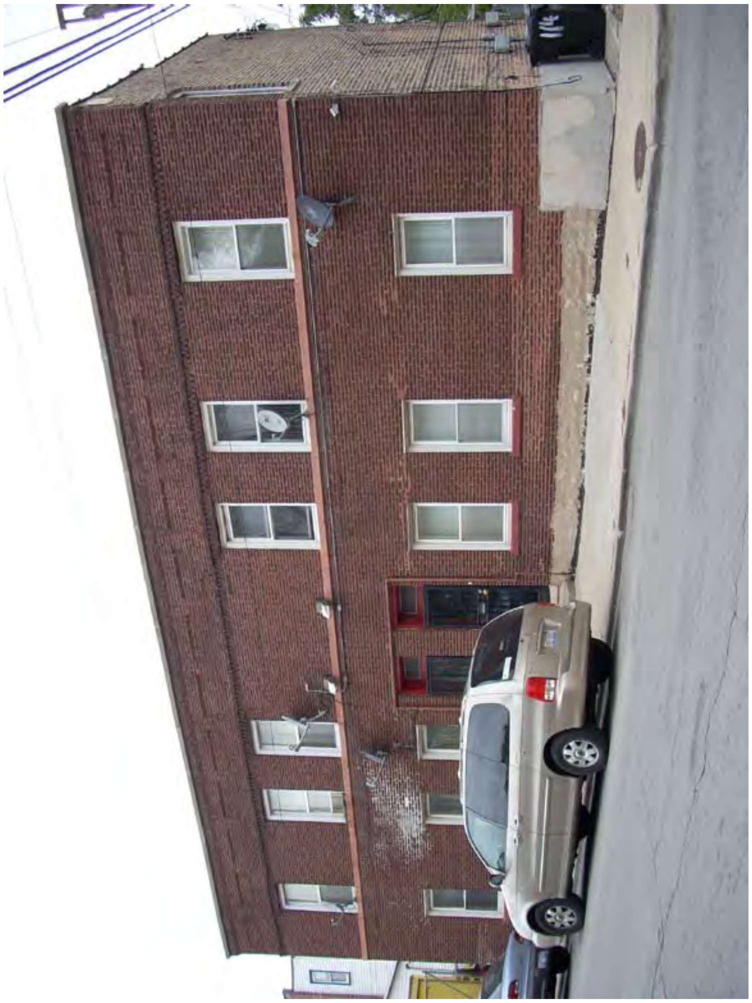
South façade of a brick, two-story, multi-family (Flat) residence.



Property Description: **Stories:** 2

This two-story brick-clad flat residential building in the West Pullman community has a flat roof and parapet. Its front elevation is clad with face brick, has two centrally-located plate glass doors with transoms, and twelve non-original one-over-one aluminum-sash windows: six on the first floor and six on the second. Detailing includes recessed brick panels with dentils at the parapet level, concrete sills, coping, and a concrete stringcourse. This building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

Photos with Captions:
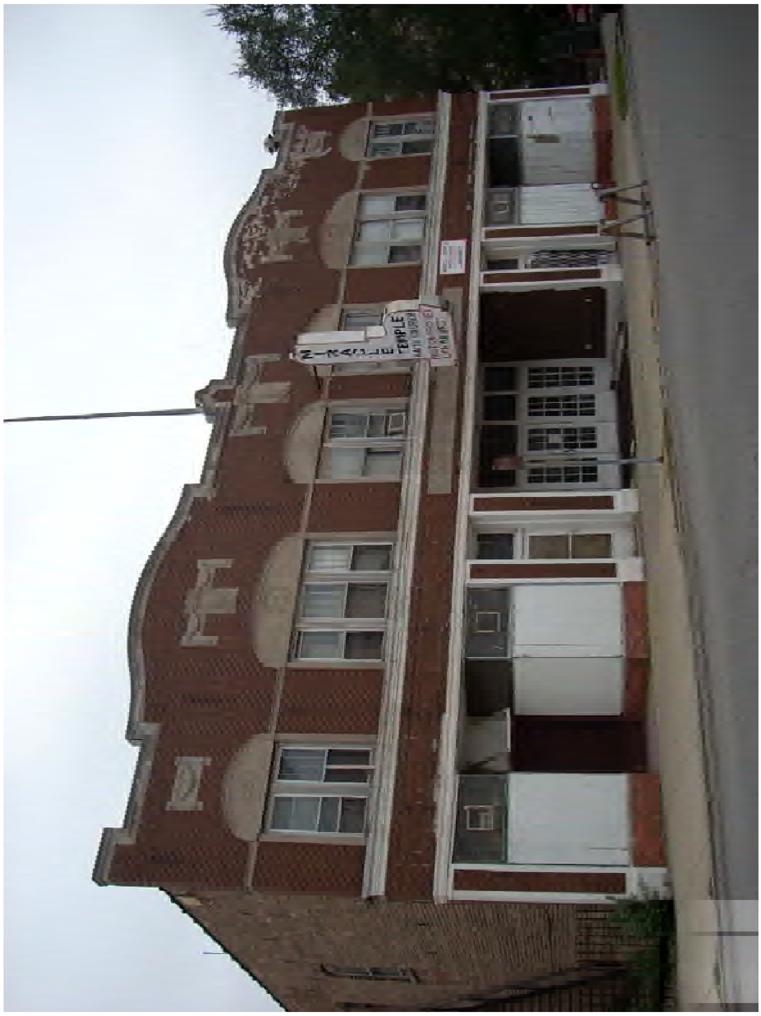
North façade of a brick, two-story, religious building.



Property Description: **Stories:** 2

This two-story building in the West Pullman community (formerly part of Kensington) was originally called "Venetian Hall." The performance hall was built for a cultural/recreational purpose, although it has long since been repurposed as a church. The 1938 Sanborn shows the hall with a stage, balcony, and place for storage of scenery. The street entrance was flanked by two storefronts in 1938, as it is now.

The building is clad with face brick on its front elevation and common brick on its side and rear elevations. The building has a flat roof and a shaped parapet with concrete coping. The first floor of the front elevation has a recessed centrally located bay with three pairs of multi-light wood doors and in-filled transoms. This central bay is flanked by two original storefronts with central recessed doors and flanking display windows that are covered with wood and topped by transoms that have been in-filled with glass block. Separating the central bay from the two flanking storefronts are two doors with transoms that provide access to the second floor. The spandrel area directly above the central entrance bay has a concrete sign plate with incised lettering that reads: “Venetian Hall.” Fenestration on the second floor features six-over-one and three-over-one wood-sash windows arranged in pairs and in groups of three, topped by round-arch stone lintels with rosette motifs. The parapet features a series of Classical shields and swags.

The exterior of this building has good overall integrity, although elements of the original storefronts materials are no longer extant. However, it does not display sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register for its architecture. Instead, is recommended for individual listing under Criterion A for its original use as a social venue for area residents in the early twentieth century. Local theater houses, such as the Venetian Hall, were jewels within the local communities. It's rare to see an early twentieth century neighborhood social hall that retains its original storefronts and is set within a residential area comprised of worker’s housing, rather than along a commercial thoroughfare. The opening of Illinois Terra Cotta works in the first half of the twentieth century brought Italians to Kensington; the area gradually became a center of South Side Italian-American life with the establishment of Venetian Hall and the nearby San Antonio de Padua (patron saint of Venice) Roman Catholic Church.

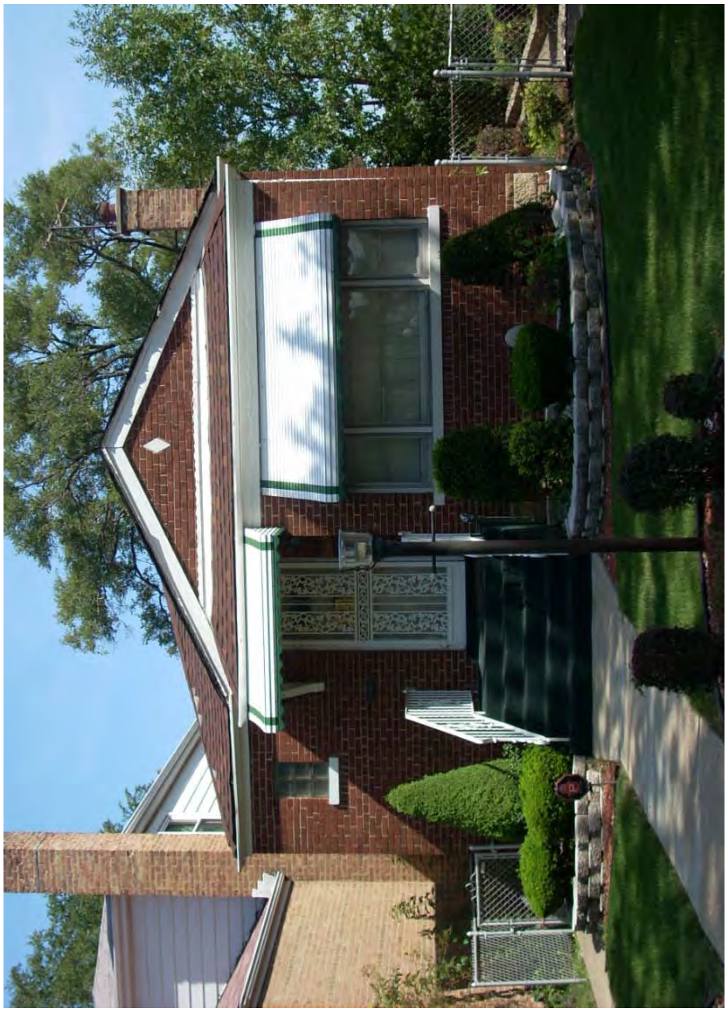
West façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised brick basement with casement windows and has a gable-on-hip roof clad with asphalt shingles. The front elevation has a pent roof, an off-center door, concrete steps with metal railings, a small glass block window, and a picture window flanked by casements. This window group is partially obscured by a low metal awning. Detailing includes a diamond-shaped tile insert in the gable end, stone quoins near the base of the residence, concrete sills, and scalloped boards above and below the pent roof. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1.5

This one-and-a-half-story house in the West Pullman community is situated on a raised basement and is clad with red face brick and synthetic siding. The building has a steeply pitched front gable roof with front-facing synthetic-clad gable. Its front elevation has a full-width, hip roof, synthetic-clad, enclosed porch with a metal storm door, concrete steps with metal railings, and a picture window flanked by one-over-one windows. The second floor of the front elevation has a pair of one-over-one windows that extend through the cornice into the synthetic-clad gable. A single one-over-one window is situated at the apex of the gable. All windows are modern replacements with aluminum sashes. The south elevation has a through-the-cornice shed dormer. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story brick-clad Craftsman bungalow at the northeast corner of Michigan Avenue and 102nd Street in the Roseland community has a hip roof with asphalt shingles, overhanging eaves, and three hip dormers with original paired wood casement windows. The front elevation wide roof overhang shelters the full-façade porch, which has a wood deck, side-facing wood steps with straight railings, and supports comprised of three brick piers topped by squat Doric columns. The front elevation features a metal storm door flanked by a single non-original one-over-one aluminum-sash window on either side. The 102nd Street elevation has two groups of three non-original one-over-one aluminum-sash windows and a gabled porch at its eastern end. This porch has a wood deck, side-facing wood steps with straight railings, and supports comprised of two brick piers topped by squat Doric columns. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

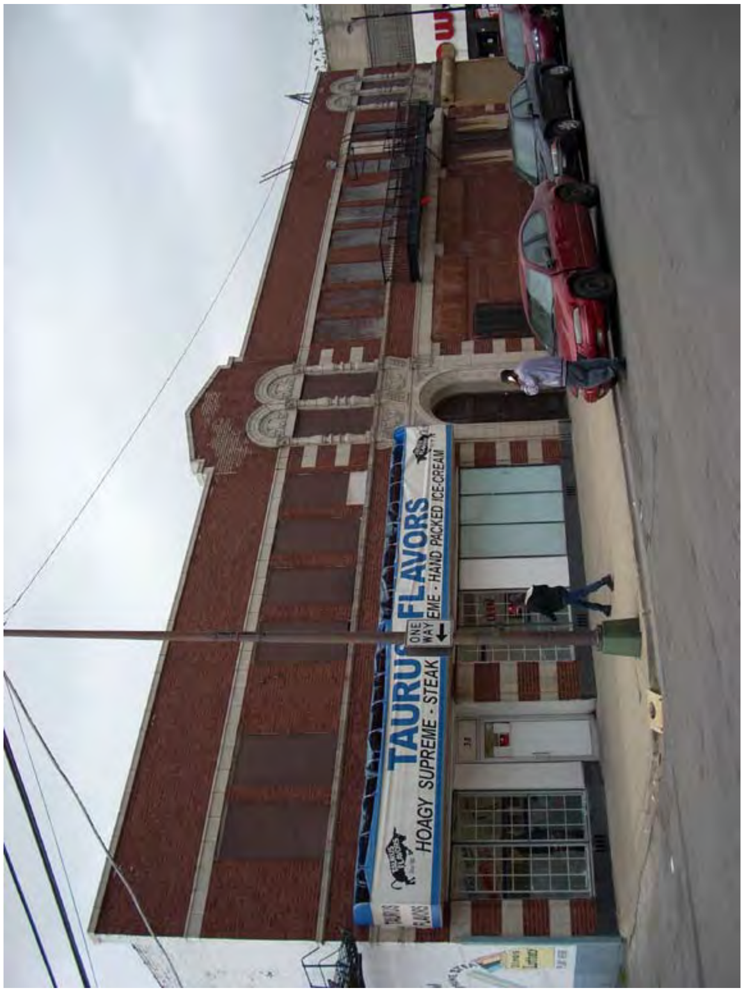
East façade of a brick, two-story, commercial building.



Property Description: **Stories:** 2

This two-story commercial building at the northwest corner of Michigan Avenue and 112th Street in the Roseland community is clad with brown face brick on its front elevation and common brick on its side elevations. The building has a flat roof and parapet. The front elevation features a centrally located entrance pavilion with a round-arch entrance and paired windows directly above surrounded by terra cotta with Classical motifs, including pilasters, shields, and swags. The entrance features original single-light wood double doors with round-arch transom. A pair of windows on the north end of the front elevation is also surrounded by terra cotta with Classical motifs, including scrolled brackets, shields, and swags. The first floor's original storefront configuration is visible but most storefront bays, which are separated by brick and tile pilasters, have either been retrofitted with non-original doors and windows or in-filled with brick. The southernmost entrance is flanked by multi-light, fixed-pane windows. The nineteen window openings that stretch across the second story front elevation have all been covered with plywood. Other detailing includes terra cotta belt courses. Although this building has retained some nice terra cotta detailing, it does not feature sufficient overall integrity to qualify as individually eligible for listing on the National Register.

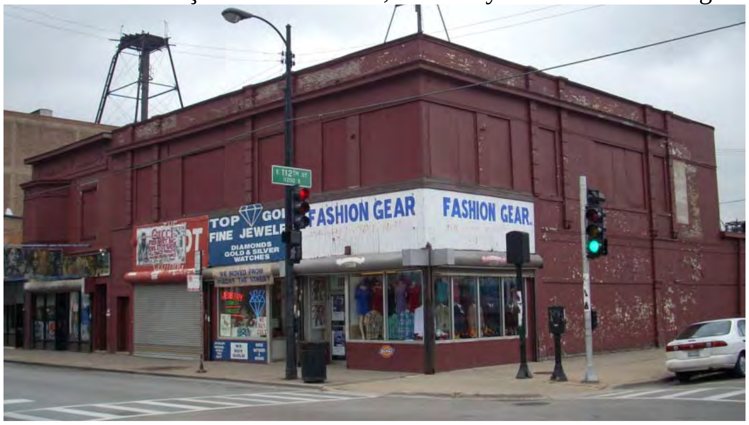
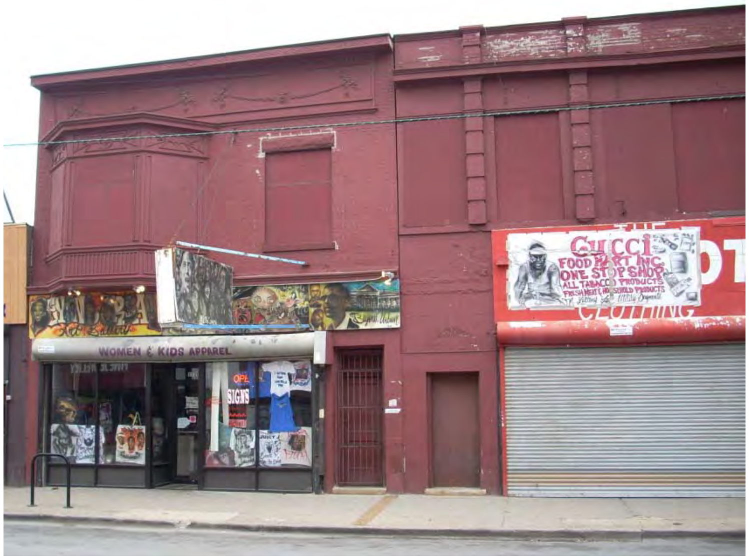
North and east façades of two brick, two-story mixed-use buildings.



East façade of southern end of buildings.



Property Description: **Stories:** 2

This address comprises two conjoined buildings. The building at 11200 (top photo) is a two-story brick-clad, flat-roofed commercial building at the southwest corner of Michigan Avenue and 112th Street in the Roseland community. The first floor has three non-original Michigan Avenue storefronts, including one at the corner, which has plate glass display windows and plate-glass double-doors. The middle storefront has plate glass display windows and a plate glass door. The southernmost storefront is hidden behind a roll-down corrugated metal covering. The second floor window openings on both street elevations of this building are in-filled with what appears to be wood. Detailing includes second floor pilasters, brick stringcourses, and a metal cornice.

The building at 11206 is the adjacent two-story, brick-clad, flat-roofed Queen Anne style commercial building to the south. Its non-original storefront has a recessed plate glass door and flanking plate glass display windows. An off-center wood paneled door with a transom provides access to the second floor, which has a three-sided metal bay and a single window; all window openings on the second floor have been in-filled with wood. Detailing includes swags at the parapet level and a metal cornice with dentil molding with decorative designs above the bay as well. These two buildings lack integrity and distinguishing architectural features and are not individually eligible for listing on the National Register.

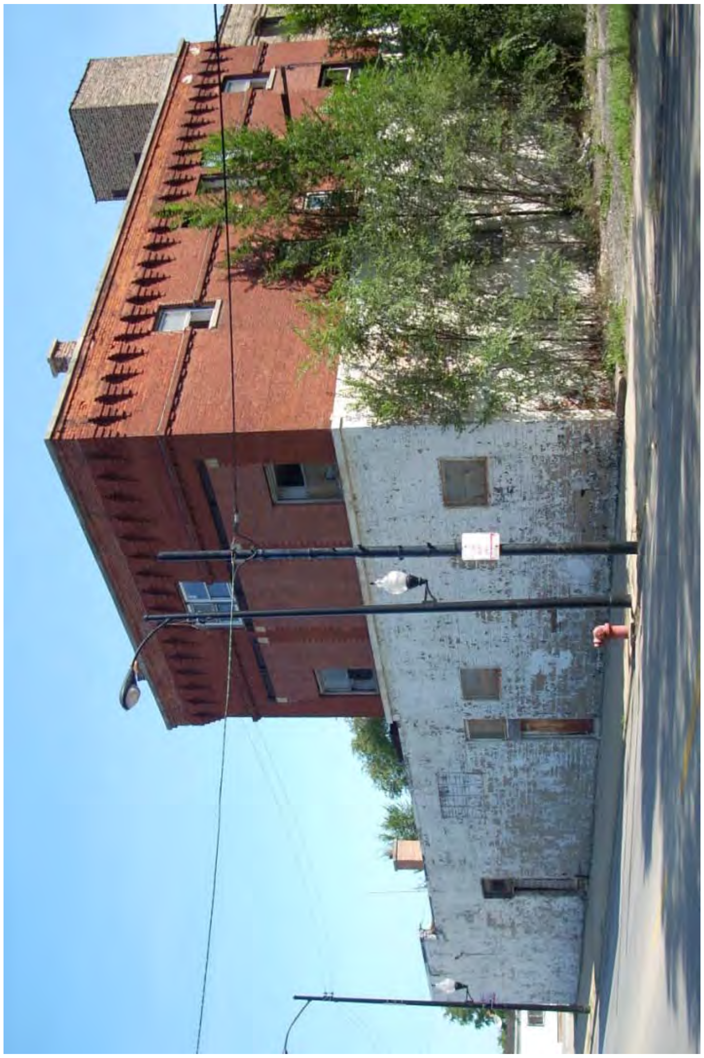
North and east façades of two-story, brick, industrial building.



Property Description:

Stories: 2

This two-story industrial building in West Pullman has a flat roof and parapet. A one-story, flat-roofed north wing is a later addition (1962). The original building has been drastically altered with new brick cladding on the first floor and the removal of original doors and windows on the front elevation. The first floor of the front elevation currently features two small non-original windows. The original window openings on the second floor of the front elevation have been in-filled with brick. Two one-over-one windows have been installed on either side. Window openings on the side elevations have all been altered as well. The parapet retains original decorative brick corbelling along the front and side elevations. This building does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

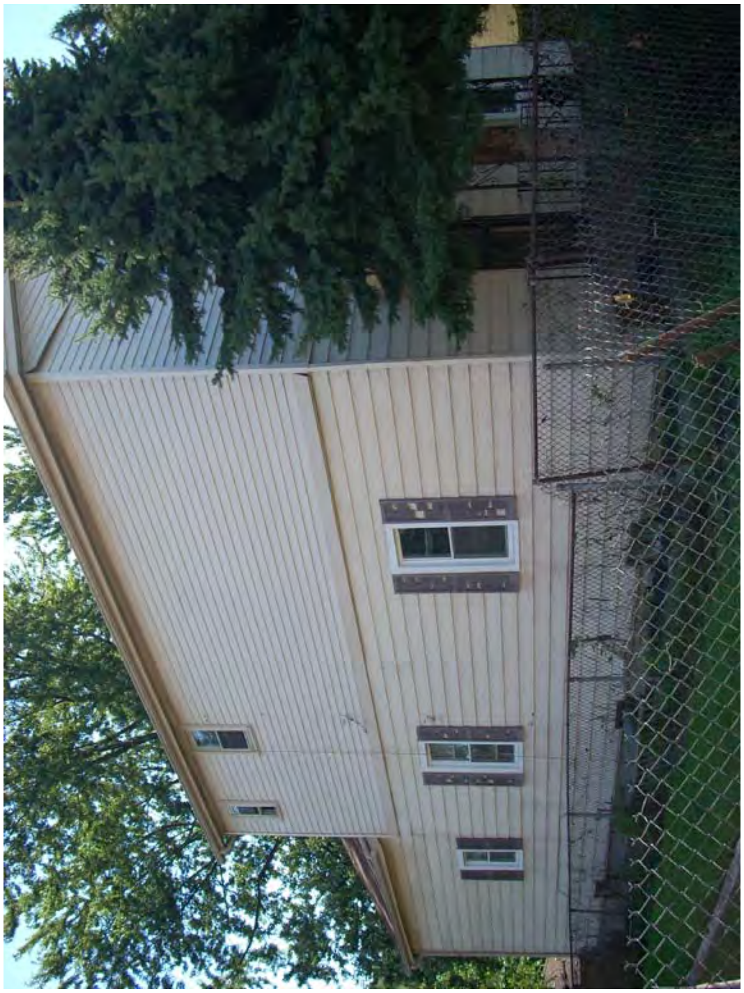
West and north façades of two-story, multi-family, frame building.



Property Description: **Stories:** 2

This two-story frame house in the West Pullman community is clad with synthetic siding and has a front gable roof with asphalt shingles. Its front elevation features an off-center non-original hollow core metal door fronted by a concrete stoop with metal railings and open metal posts supporting a metal canopy. There are two windows on the first floor and two on the second, all of which are non-original one-over-one aluminum sash.

The 1938 Sanborn shows this residence as a 1.5-story building with a round bay pavilion. Subsequent alterations, including the addition of a full second floor have heavily altered this building. This house lacks integrity, does not have distinguishing architectural features, and is not individually eligible for listing on the National Register.

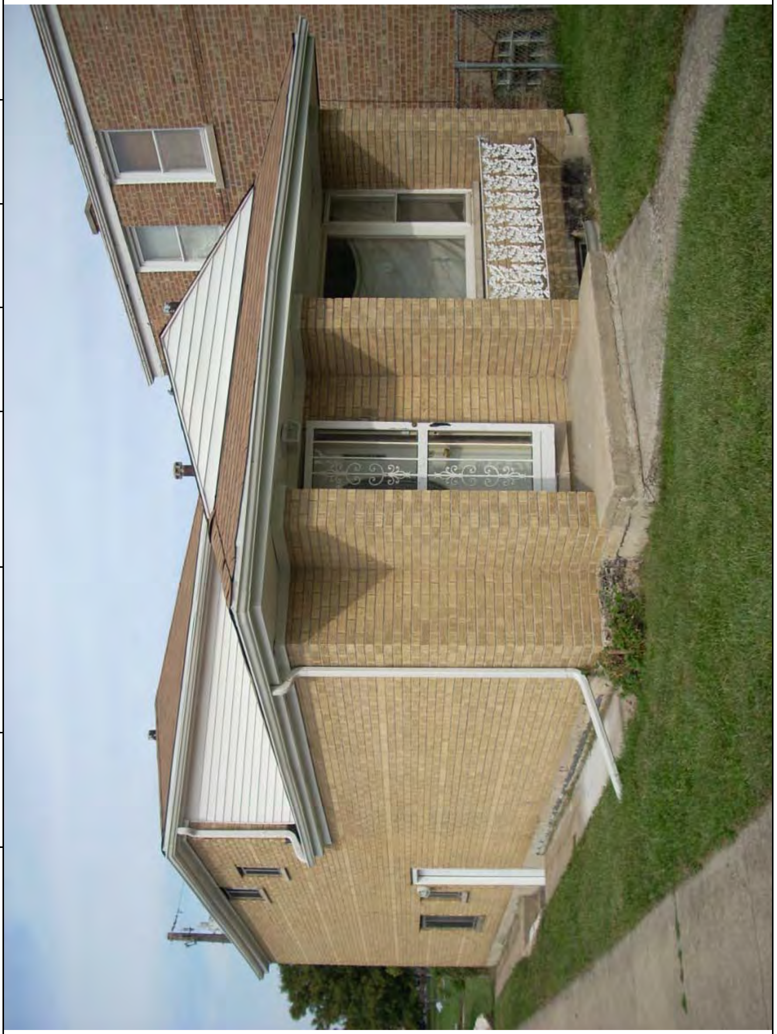
East and south façades of split-level, brick, single family residence.



Property Description: **Stories:** Split-level

This back-split house at the northwest corner of Normal Avenue and 98th Place in the Washington Heights community is clad with buff brick, while the front façade of the split is covered with synthetic siding. The rear portion of the house has a hip roof, while the front portion has a gable-on-hip roof with a synthetic-covered gable. The front elevation has an off-center hollow core metal door, a picture window flanked by non-original one-over-one aluminum-sash windows with a decorative lacey metal panel beneath, and a wide overhang supported by three brick piers. It does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

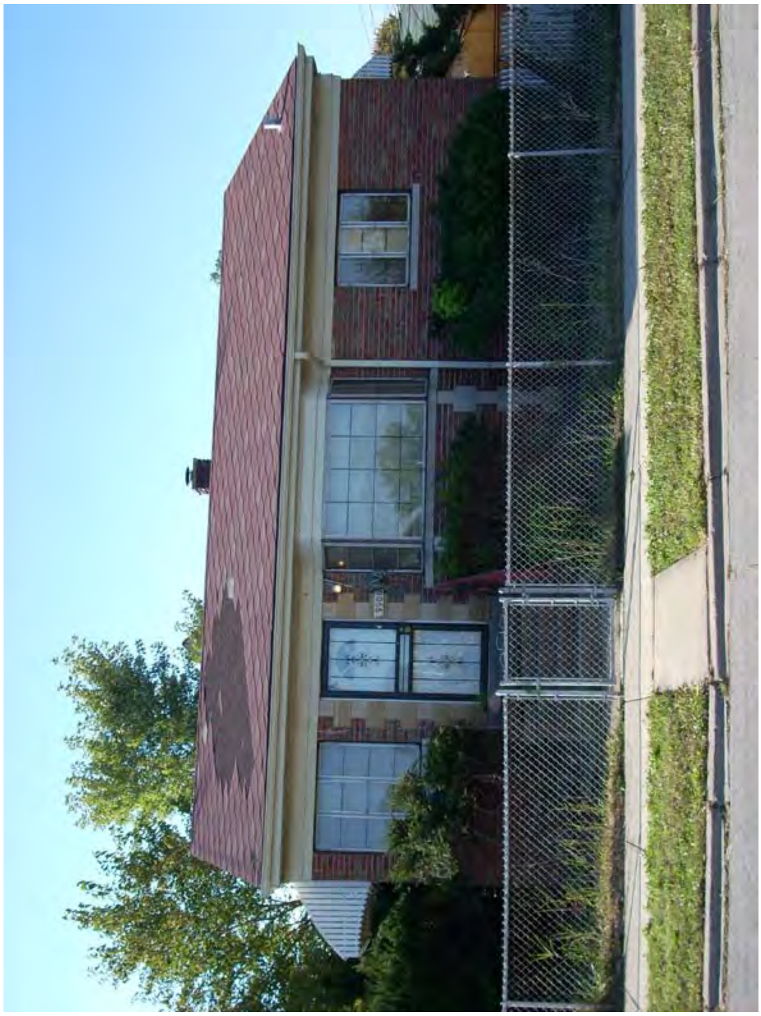
East façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story home at the southwest corner of Normal Avenue and 99th Street in the Washington Heights community sits on a raised basement and is clad with face brick. The building has a side-gabled roof covered with asphalt shingles and synthetic-clad gabled ends. The front elevation has an off-center hollow core metal door, concrete steps with metal railings, a centrally located three-sided multi-light window bay, and two strips of three casement windows. Detailing includes stone quoins at the base of the window bay, decorative buff brick flanking the door, and concrete sills. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

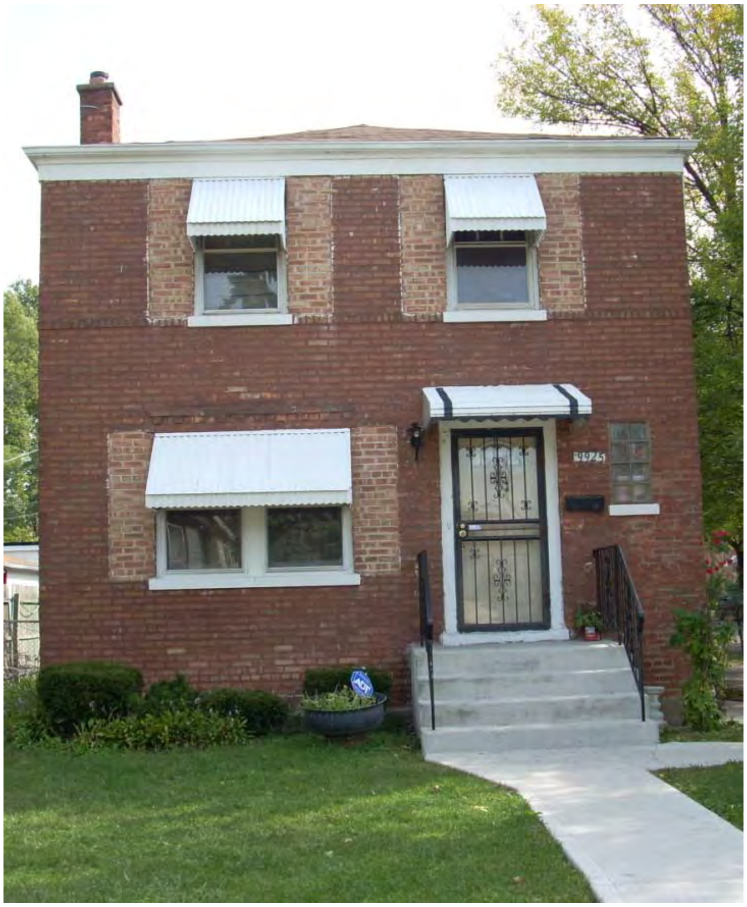
West façade of two-story, brick, single-family residence.



Property Description: **Stories:** 2

This two-story brick-clad house at the southeast corner of Normal Avenue and 99th Place in the Washington Heights community is situated on a raised basement with glass block windows. The building has a hip roof covered with asphalt shingles. Its front elevation has an off-center non-original hollow core metal door, a small adjacent glass block window, concrete steps with metal railings, a pair of non-original double-hung windows on the first floor, and two non-original double-hung windows on the second floor. The door and all front elevation windows have metal awnings. Details include a brick stringcourse and corbelling above first floor window. The difference in the brick colors relates to the removal of shutters. It does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

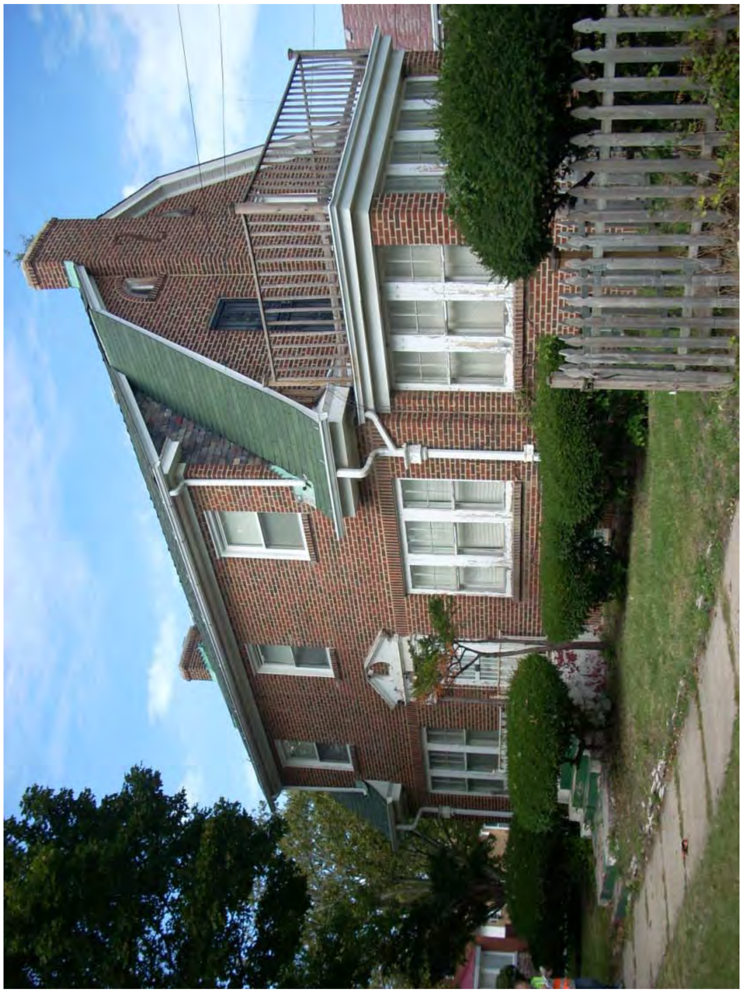
South and west façades of a brick, two-story, single family residence.



Property Description: **Stories:** 2

This two-story Dutch Colonial style house at the northeast corner of Normal Avenue and 105th Street in the Roseland community is situated on a raised basement and is clad with red face brick. The building has a side-gambrel roof covered with asphalt shingles, a one-story flat-roofed enclosed sun porch surrounded by four-over-one wood-sash windows along its east elevation, and exterior chimneys on both side elevations. The front (105th Street) elevation has a centrally located non-original hollow core metal paneled door, concrete steps, and metal railings. The door was once flanked by fluted pilasters with geometric capitals. The shaft of one of these pilasters has been removed as has the base of the extant pilaster. The door is topped by an unadorned frieze band and a broken pediment and is flanked by strips of three six-over-one and four-over-one wood-sash windows on either side. The shed-roofed second floor of the front elevation has three non-original one-over-one aluminum-sash windows. This house does not have sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story brick-clad house in the Roseland community is situated on a raised basement with glass block windows and has a hip roof covered with asphalt shingles. Its front elevation features a pent roof that spans the three-sided living room bay and an off-center hollow core metal door that is accessed by concrete steps with metal railings. The living room bay features a picture window flanked by non-original one-over-one aluminum-sash windows that are sheltered by a metal awning. The second floor of the front elevation has two non-original one-over-one aluminum-sash windows. Detailing includes concrete sills and decorative stones at the basement level. It does not feature distinguishing architectural features nor does it retain sufficient integrity, therefore, is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story Ranch house at the corner of Normal Avenue and 107th Street in the Roseland community is situated on a raised basement and is clad with orange face brick below the sill line and buff brick above. The building has a cross-gable roof covered with asphalt shingles; gable ends are clad in synthetic siding. A gabled rear wing contains an attached two-car garage. The front (Normal Ave.) elevation has an off-center metal storm door sheltered by a roof overhang supported by a corner open metal post, concrete steps with metal railings, two pairs of non-original one-over-one aluminum-sash windows, and a non-original picture window flanked by one-over-one aluminum-sash windows on the main block. The front elevation of the rear wing has an off-center metal storm door, a roof overhang supported by two open metal posts, and a large glass block window. The side (107th Street) elevation has corner windows that are obscured by foliage but appear to be casements. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

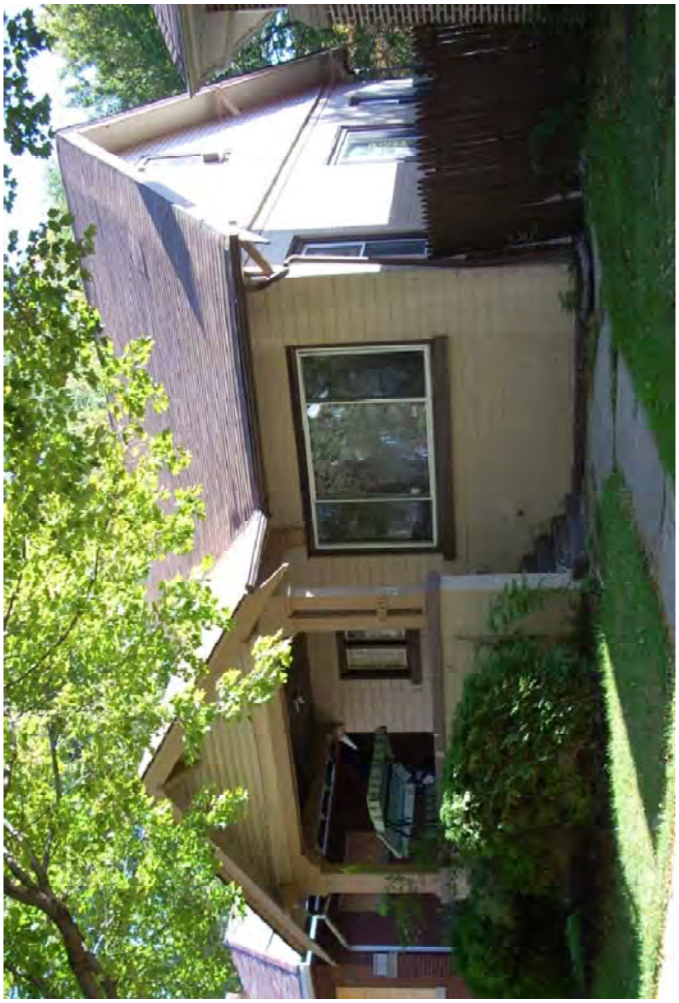
South and east façades of a one-story, single family residence.



Property Description: **Stories:** 1

This one-story Craftsman cottage in the Roseland community has a side-gable roof with overhanging eaves and decorative knee braces. The building is made of masonry units with aluminum siding in its gabled ends. Its front elevation has a recessed corner porch with overhanging gable roof with rafter tails, low walls, and squat, squared wood column supports. The building features a front door tucked into the side of the living room bay, a strip of three casements, and a picture window flanked by what appear to be casements. All windows on the front elevation feature concrete sills. Side elevation windows appear to be non-original one-over-one aluminum-sash. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

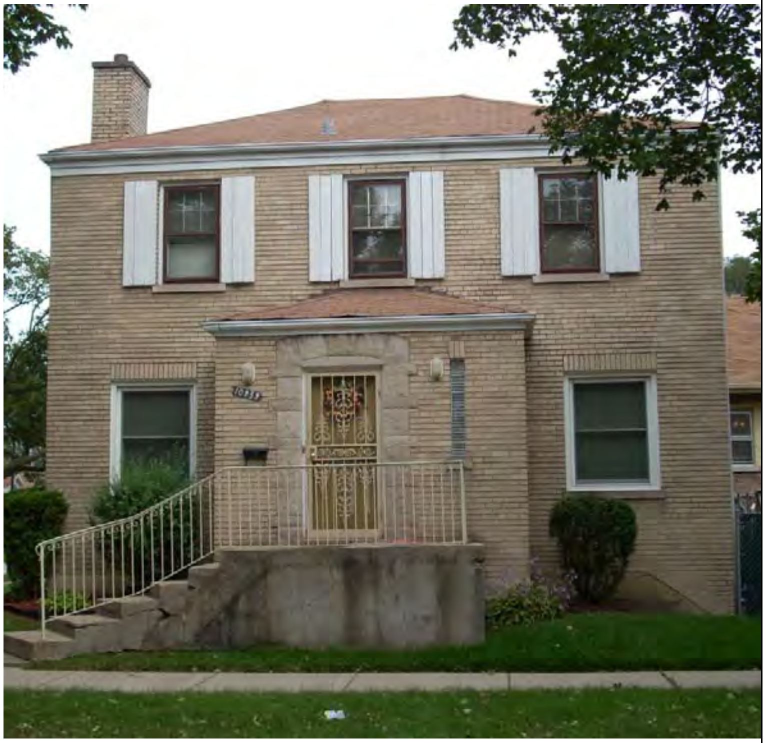
South façade of two-story, brick single-family residence.



Property Description: **Stories:** 2

This two-story house at the corner of Normal Avenue and 110th Street in the Roseland community is clad with buff brick and has a hip roof covered with asphalt shingles, an exterior buff brick chimney, and a raised basement. Its front elevation features a centrally located hipped-roof entrance vestibule with a door that is surrounded by decorative stones. A vertical strip of glass blocks adjacent to the door accents the façade. Concrete steps and metal railings lead to the entrance. There are five windows—two on the first floor and three on the second. The first floor windows are non-original one-over-one aluminum-sash while the second floor windows are six-over-one. Detailing includes concrete sills and brick flat arch window lintels. This house lacks sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

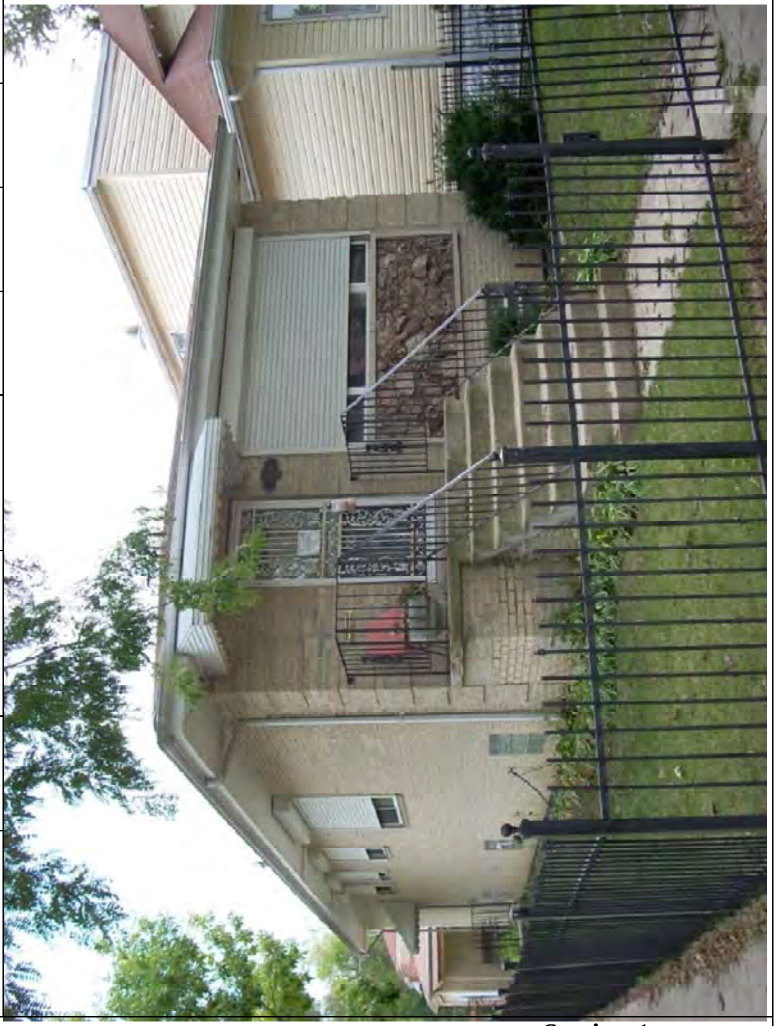
West façade of one-story, brick single-family residence.



Property Description: **Stories:** 1

This one-story house in the Roseland community is situated on a raised basement with glass block windows. The building has a front elevation clad with buff face brick, a hip roof covered with asphalt shingles, and overhanging eaves. Its front elevation has an off-center entrance with a metal storm door sheltered by a metal awning, concrete steps with metal railings, and a window group with a large decorative faux stone panel beneath. This house lacks sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

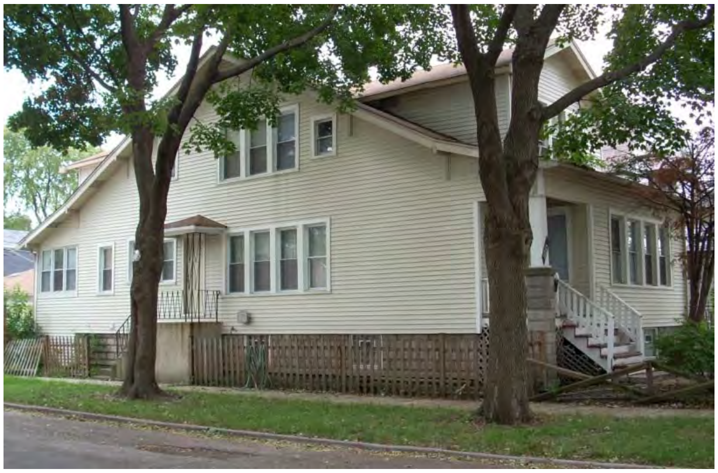
West and north façades of residence.



Property Description: **Stories:** 1

This single story frame house at the southeast corner of Normal Avenue and 110th Place in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a side gable roof covered with asphalt shingles and flared, bracketed, overhanging eaves. It features both front and rear gable dormers. It has a recessed corner porch with non-original hollow core metal door, a faux stone corner pier topped by a squat squared wood column, and wood steps and railings. The front elevation has a strip of four windows on the first floor and three in the gable. Above the basement, windows are non-original one-over-one aluminum-sash. A small hip-roofed porch is situated along the 110th Place elevation with hollow core metal door (non-original), concrete steps with metal railings, and open metal supports. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

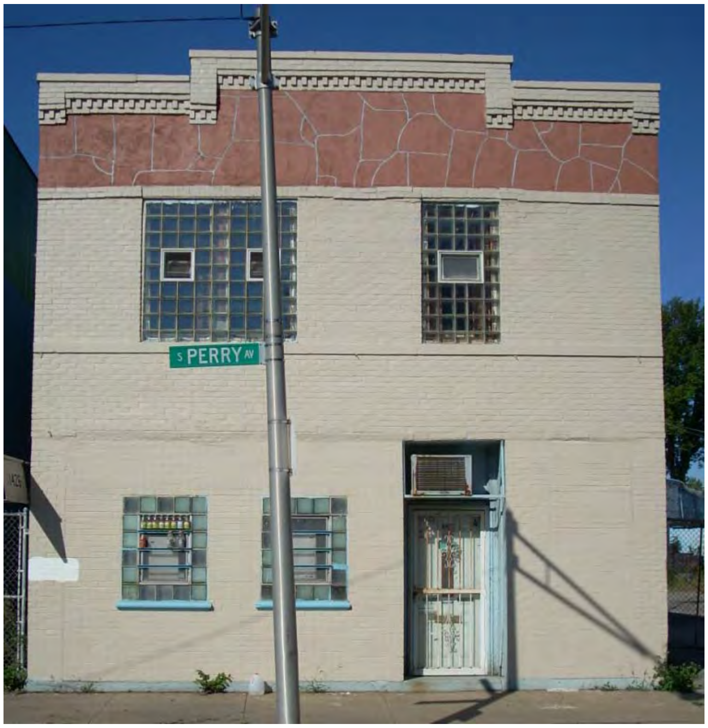
East façades of brick building in industrial complex.



Property Description: **Stories:** 2

This two-story industrial building in the Roseland community has a flat roof and parapet. It sits within an industrial complex bounded by South Perry Avenue, an alley, and the Union Pacific Railroad line. Its front elevation is clad in painted brick. It has a hollow core metal door with in-filled transom and window openings on the first and second floors that are in-filled with glass block with louvered or casement insets. Most of the face brick at the parapet level has been replaced by a stucco-like material. The uppermost portion of the stepped parapet has bricks arranged as decorative dentils. Other buildings within the paint company complex include one-story sheet metal and brick buildings. These buildings lack integrity, do not have distinguishing architectural features, and are not individually eligible for listing on the National Register.

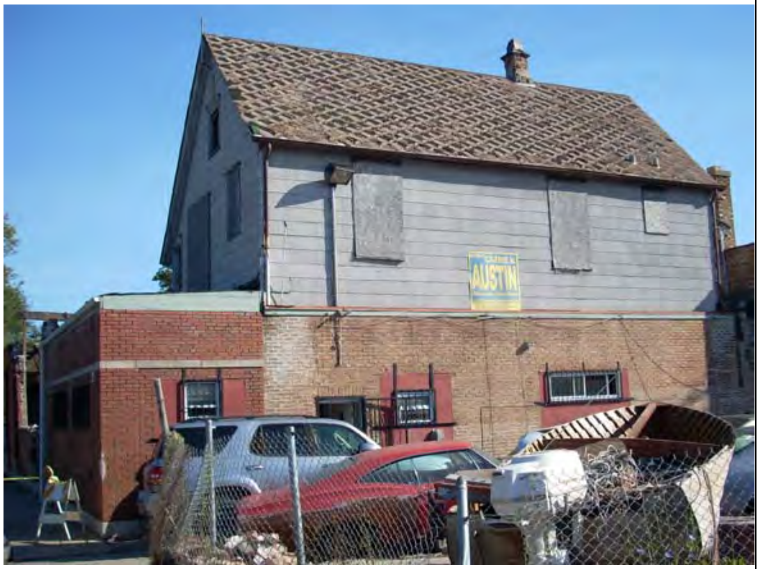
South façade of "building A" in a set of three joined industrial buildings. (Additional photographs appended).



Property Description: **Stories:** various

This industrial complex of buildings in the Roseland community includes three conjoined brick buildings: a two-story gable-roofed building (A, photo above), a collapsed brick building (B, photos on page 3), and a two-story flat-roofed brick building (C, photos on page 3). Building A has first floor clad in brick with a one-story, flat-roofed, brick commercial wing in front. The upper half of this building is clad in synthetic siding covering clapboards. It is vacant, deteriorated, and many of its window openings have been covered with particle board. Windows along the south side on the first floor are sliding or double-hung. Building B has collapsed. Building C at the far north has a parapet and is clad with red face brick and common brick. The windows with arched lintels have been in-filled with wood and brick. A new door pierces the façade. This complex of building lacks integrity, does not have any distinguishing architectural features, and is not individually eligible for listing on the National Register.

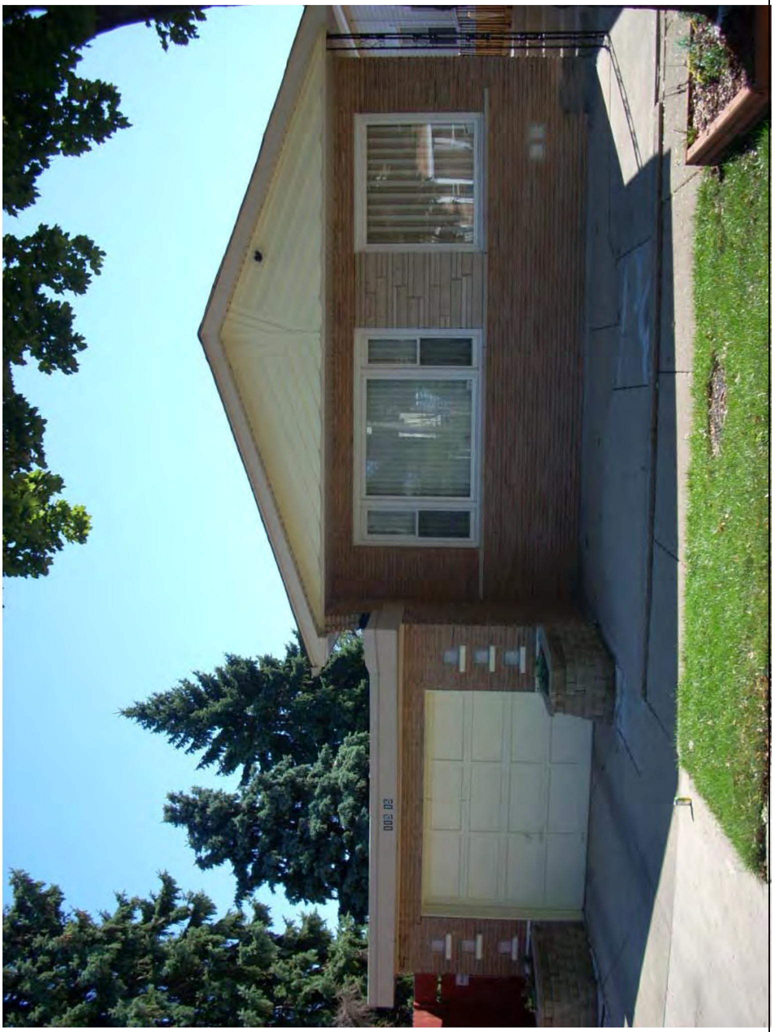
West façade of one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story house in the West Pullman community has a gable roof covered with asphalt shingles, overhanging eaves, and a flat-roofed attached one-car garage. Glass blocks with stone sills and brick planter boxes decorate the front of the garage. The front elevation of the house is clad with light orange face brick and features two picture windows, one of which is flanked by narrow one-over-one windows. A stone panel separates the two picture windows. The front gable is clad with synthetic siding in a decorative pattern. The entrance is located along the side elevation and accessed via a flight of concrete steps with metal railings. This house does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

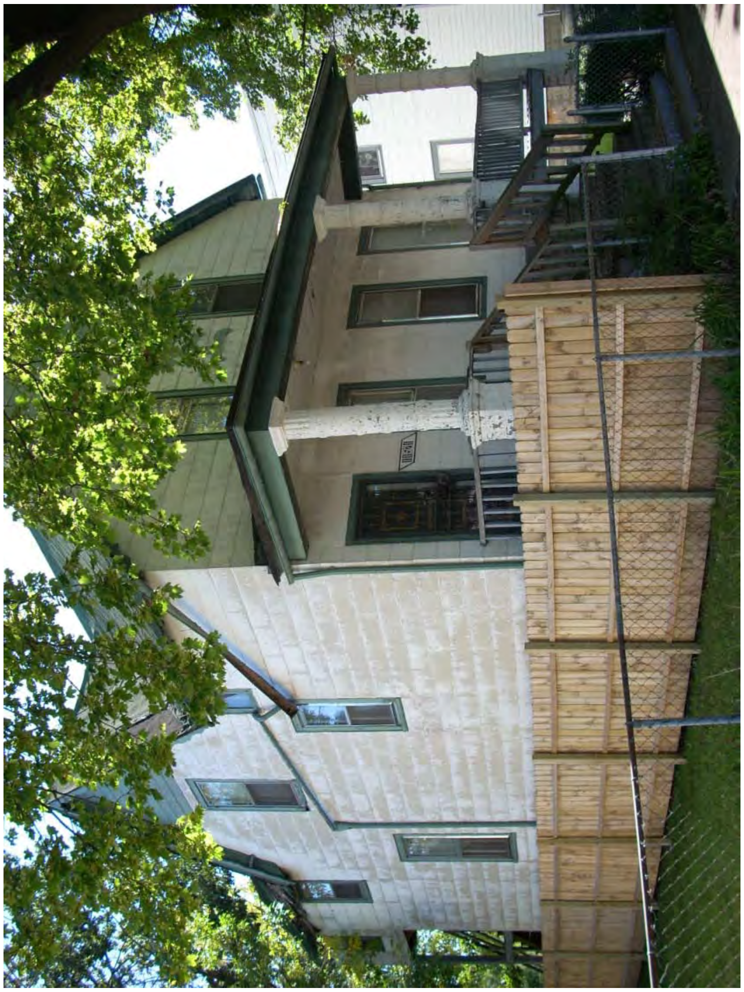
West façade of a 1.5-story, multi-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the West Pullman community is situated on a raised concrete block basement and is clad with synthetic siding. The building has a cross-gable roof covered with asphalt shingles. The front elevation has a full-width wood porch with a flat roof that is supported by faux stone piers topped by short Doric columns. The façade features an off-center non-original hollow core metal door and five non-original one-over-one aluminum-sash windows: three on the first floor and two on the second. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

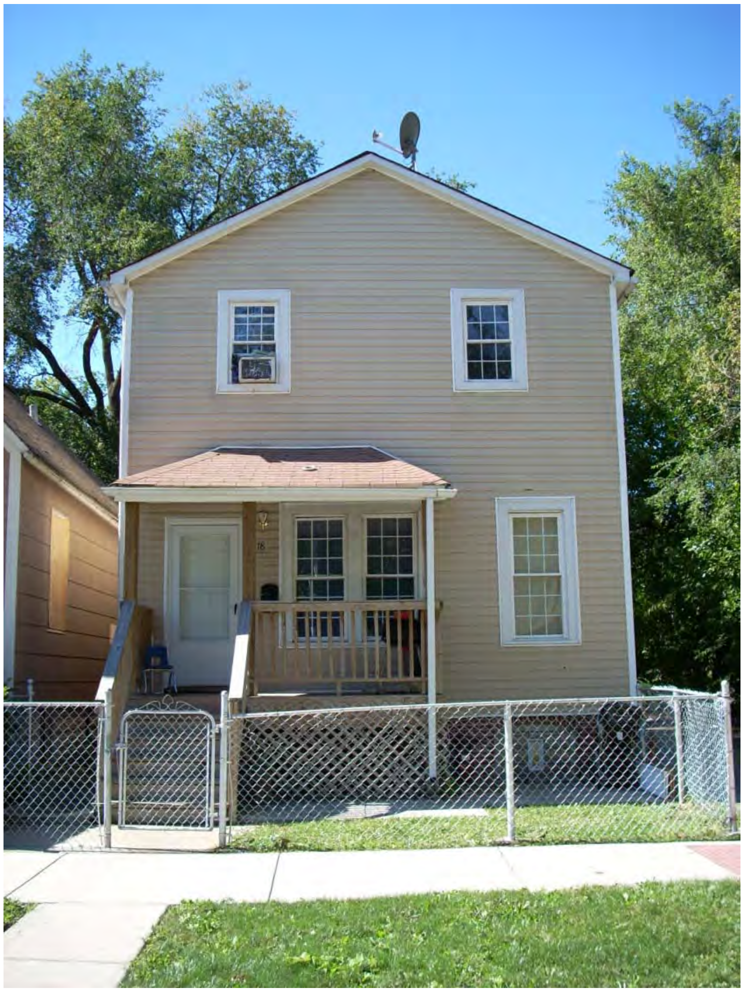
East façade of a two-story, single family, frame residence.



Property Description: **Stories:** 2

This two-story house in the West Pullman community is situated on a raised brick basement and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. The second story was added in the last few years. Its front elevation has a partial-width, hip-roof wood porch with straight posts and railings, an off-center non-original hollow core metal door, and five multi-paned double-hung windows: three on the first floor and two on the second, all non-original. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

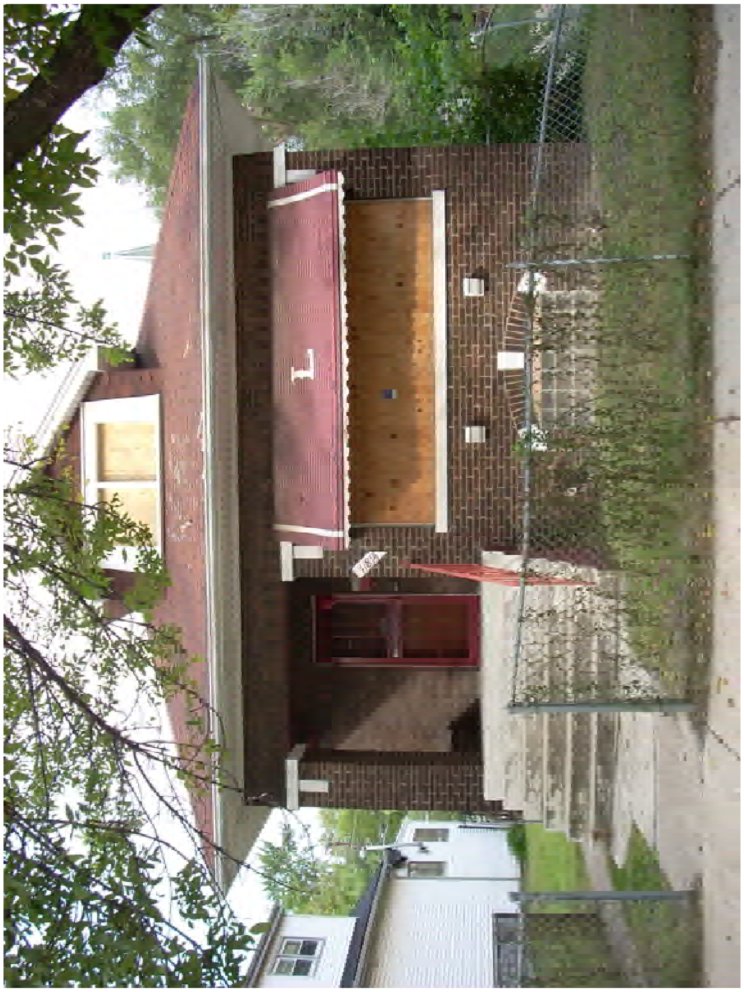
East façade of a one-story, single family, brick residence.



Property Description: **Stories:** 1

This one-story brick-clad bungalow in the West Pullman community is situated on a raised basement with glass block windows. The building has a hip roof covered with asphalt shingles, overhanging eaves, and gable dormers along its front and rear elevations. The front elevation has a recessed corner porch with a brick pier support at the corner, concrete steps, and a metal railing. Above the basement, windows have been covered with plywood. Detailing includes soldier brick lintels, concrete sills, and concrete insert blocks used as decorative accents. This is an example of a Chicago bungalow, a building type that the City of Chicago has recognized through its Historic Chicago Bungalow Initiative. However, this house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

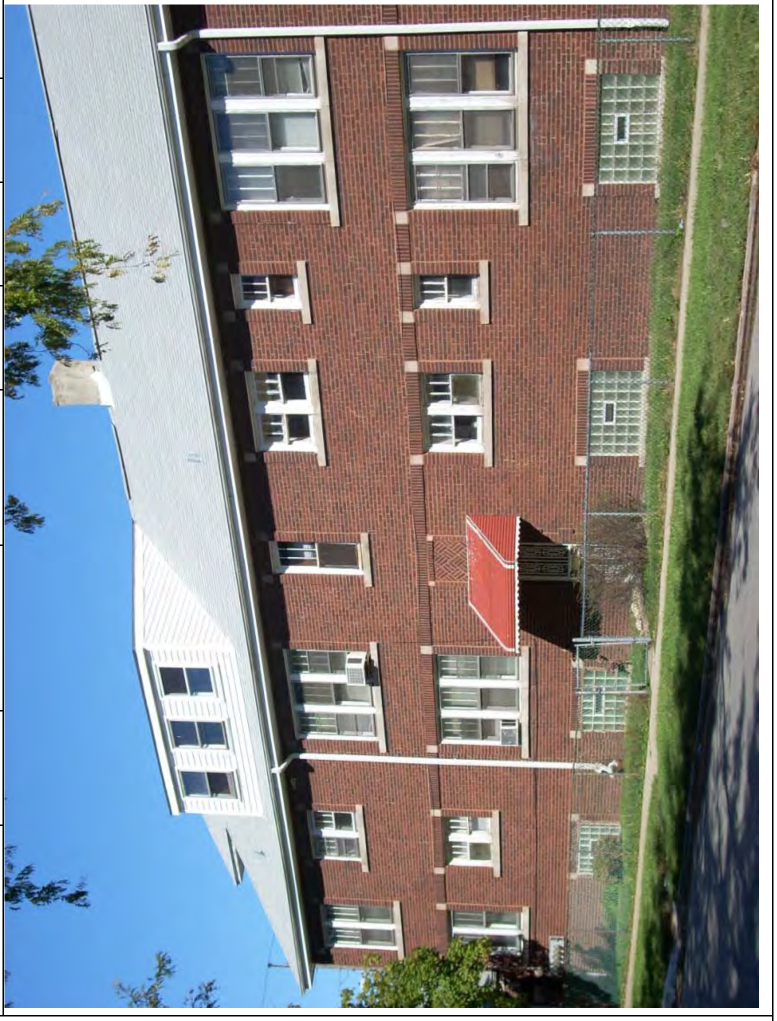
South façade of two-story, multi-family residence.



Property Description: **Stories:** 2

This two-story multi-family building at the northwest corner of 100th Street and Princeton Avenue in the Roseland community is clad with brown face brick along its two street elevations. It has a raised brick basement with glass block windows, a hip roof covered with asphalt shingles with overhanging eaves, a shed dormer along its 100th Street elevation, and a hip dormer along its rear elevation. The front elevation has an off-center hollow core metal door with two strips of three windows—one on the first floor and one on the second—along with an additional window on the second floor. Fenestration along both street elevations is comprised of three-over-one wood-sash windows. Detailing includes concrete sills, window surrounds with soldier bricks and square concrete insert blocks, and a course of soldier bricks above the first floor windows that spans both street elevations. The brick panels above both the front and side doors feature the same decorative basketweave pattern. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

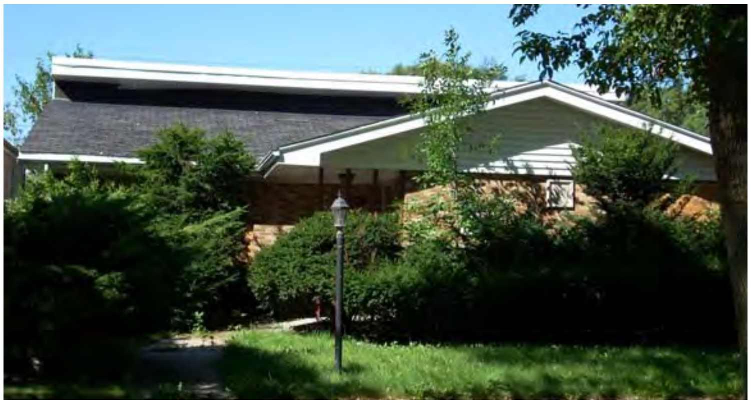
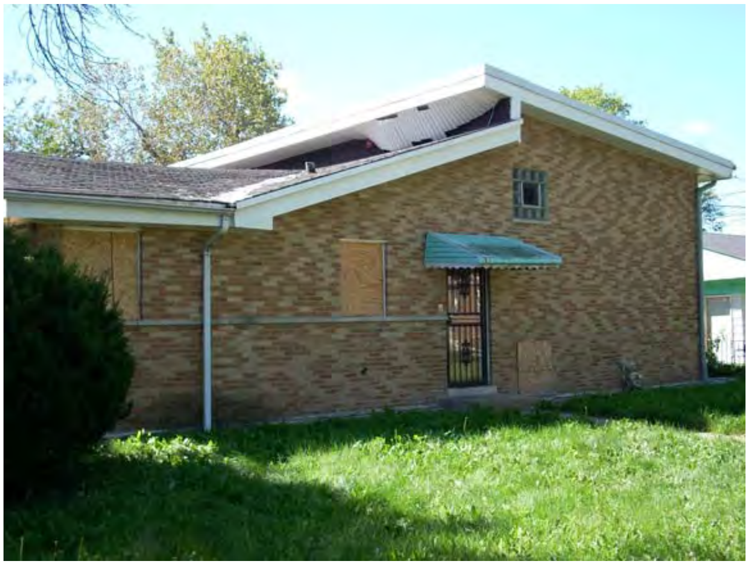
East façade of split-level, brick single family residence.



North façade of split-level showing roofline.



Property Description: **Stories:** 1

This split-level home in the Roseland community has a cross-gabled roof covered with asphalt shingles and is clad with buff and orange face brick. The front elevation's gable is clad with aluminum and has a deep overhang that is supported by two open metal posts. The roofline exhibits an overhanging shed roof along the ridgeline, running the width of the house. The eave of this overhang is clad in vinyl siding. The front elevation's windows and door are obscured by high foliage. Three of the four side elevation windows are covered with plywood. This house does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

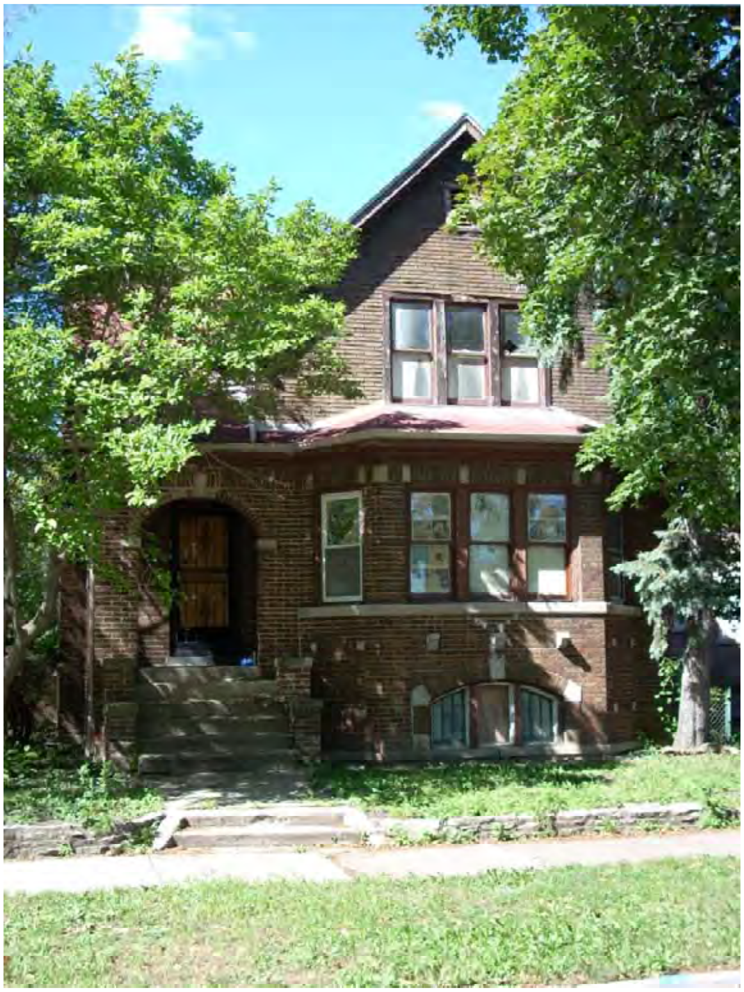
East façade of a brick, two-story, single family residence.



Property Description: **Stories:** 2

This two-story house in the Roseland community is situated on a raised brick basement. It is clad with brown face brick and has a cross-gable roof covered with asphalt shingles. Its front elevation has an arched basement window group, an off-center door with a metal storm, a corner recessed porch with concrete steps and metal railings, a projecting three-sided hip-roofed living room bay with five double hung sash windows, and a strip of three one-over-one windows on the second floor. Detailing includes a stone sill course and a decorative soldier course with stone insert blocks above the living room bay windows, decorative scrolled stone brackets below the living room bay windows, and a porch archway with stone keystone. The side elevation has a shed-roofed window bay with large glass block window opening. The rear elevation's original roofline has been raised with a shed-roofed addition. This house does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

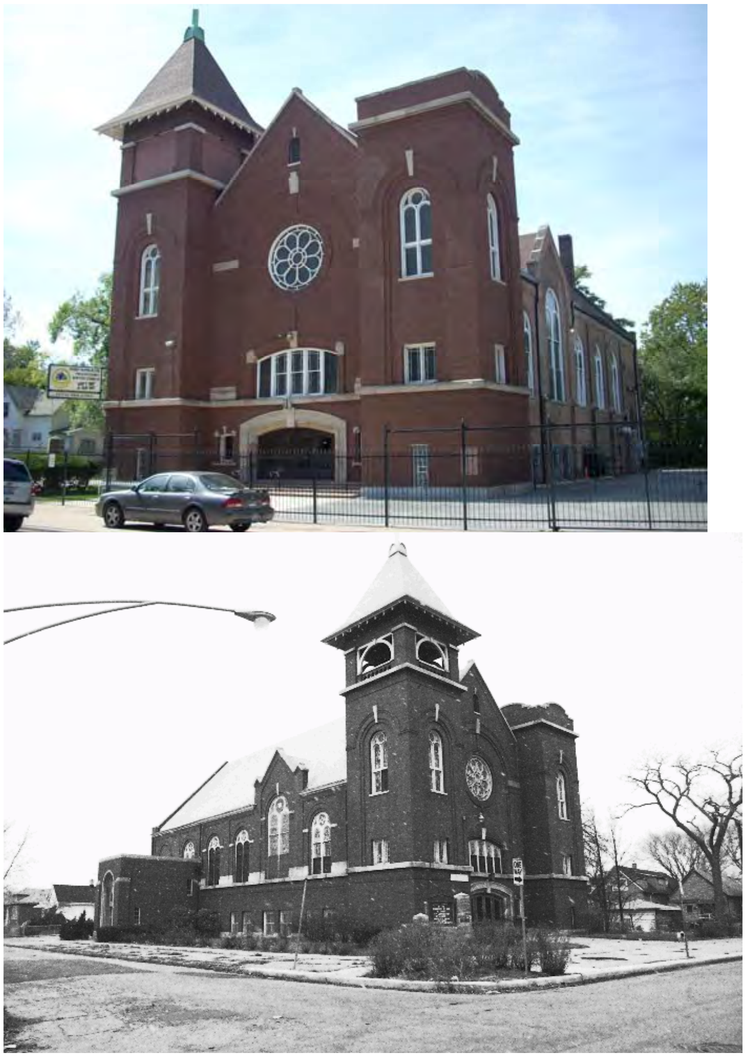
East façade of two-story religious building (above), south and east facades from HAARGIS (below).



Property Description: **Stories:** 2

This Romanesque Revival style church in the Roseland community has a front elevation and two flanking towers clad with brown face brick, while the remainder of the side elevation and the rear elevation are clad with common brick. It has a gable roof covered with asphalt shingles and gable wall dormers with shaped parapets on both side elevations. The east tower has a flat roof and a shaped parapet while the west tower has a peaked roof with overhanging eaves and exposed rafters and is topped by a finial. The central bay of the front elevation has a broad, round-arched entrance with stone surround and two sets of single-light oak double-doors. The central bay also contains a strip of double-hung windows situated within a broad arch and a rose window with tracery. Fenestration on the both towers and along the side elevations comprises round-arch windows with tracery. It is unknown whether the original stained glass for all of these windows is extant inside the church. Both towers also feature paired casement windows. Window openings at the top of the west tower have been boarded-over. Detailing includes stone sills, belt courses, brick pilasters and keystones. A one-story brick-clad entrance vestibule is situated along the rear of the west elevation. Built as the First Reformed Church of Roseland, this church is recommended as individually eligible for National Register listing under Criterion A for its association with the community's once-dominant Dutch population and under Criterion C as fine example of a Romanesque Revival style church in Roseland.

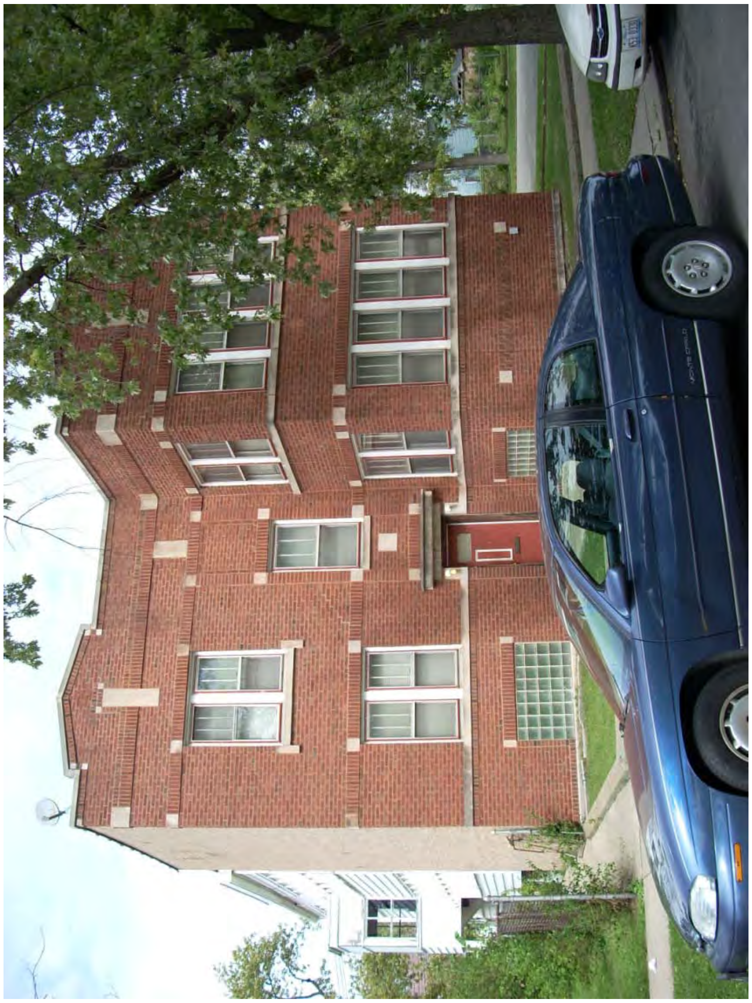
South façade of a brick, two-story, apartment building.



Property Description: **Stories:** 2

This two-story apartment building at the northwest corner of Princeton Avenue and 111th Place in the Roseland community is situated on a raised basement with glass block windows and is clad with brown face brick on its two street elevations. The building has a flat roof and shaped parapet with concrete coping. Windows are original three-over-one wood-sash windows arranged singly, in pairs, or in groups of four. The Princeton Avenue elevation also features four leaded glass casement windows. Each street elevation has an entrance with a non-original hollow core metal door. Detailing includes concrete sills and brick soldier courses with square stone inserts blocks. This building lacks sufficient distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story, former industrial building at the corner of Sangamon and 118th streets in the West Pullman community is clad with brown face brick along its two street elevations and has a flat roof and parapet with brick pediment. The corner entrance has a non-original plate glass door with sidelight and a transom that has been in-filled with wood. The window openings along both street elevations have been in-filled with glass block. The Sangamon Street elevation has an off-center hollow core metal door and a transom that has been in-filled with wood. Detailing along both street elevations includes square insert blocks used as decorative accents, rectangular brick panels at the base and parapet level, concrete sill course, and a metal cornice. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

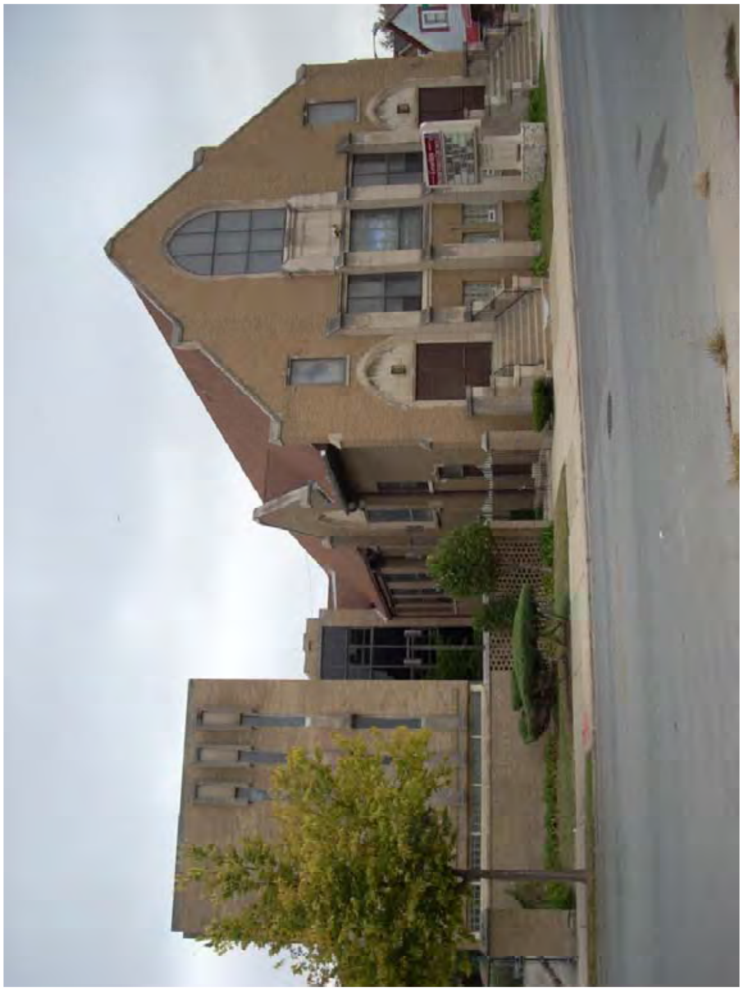
East façade of a two-story, brick religious building.



Property Description: **Stories:** 2

This 1910 Gothic Revival style church at the southwest corner of State and 112th streets in the Roseland community is situated on a raised basement with glass block windows and is clad with tan face brick on its front elevation and common brick on its side and rear elevations. The church has a gable roof covered with asphalt shingles and a parapet with concrete coping. The gable front elevation has brick corner buttresses. A pair of wood double-doors each topped by a stone tympanum is located at either end of the gable front. The doors are accessed by concrete steps with low stone sidewalls. Windows at the gable end include a central bay with three large windows separated by stone buttresses and topped by a large stained glass window with pointed arch. Single windows are also situated above both front entrances. Most of the gable fenestration appears to be stained glass. The side elevations feature through-the-cornice gabled wall dormers with brick buttresses flanked by a series of double-hung windows. Additional detailing includes stone window hoods and sills, stone door surrounds with foliate motif, stone buttresses, and a panel inscribed “Presbyterian Church of Roseland.” The church is attached via a flat-roofed wing to a 1936 three-story flat-roofed school. The front (State Street) elevation of the school is clad with tan face brick and has vertical slit windows on the second and third floors and concrete spandrels. The school's first floor elevation is obscured by a brick wall. This building does not stand out as one of the best examples of a Gothic Revival church in Roseland; other churches in this style that are more distinctive in terms of their architectural features, craftsmanship and detailing are is the area. As a result, this church is not recommended as eligible for individual listing on the National Register.

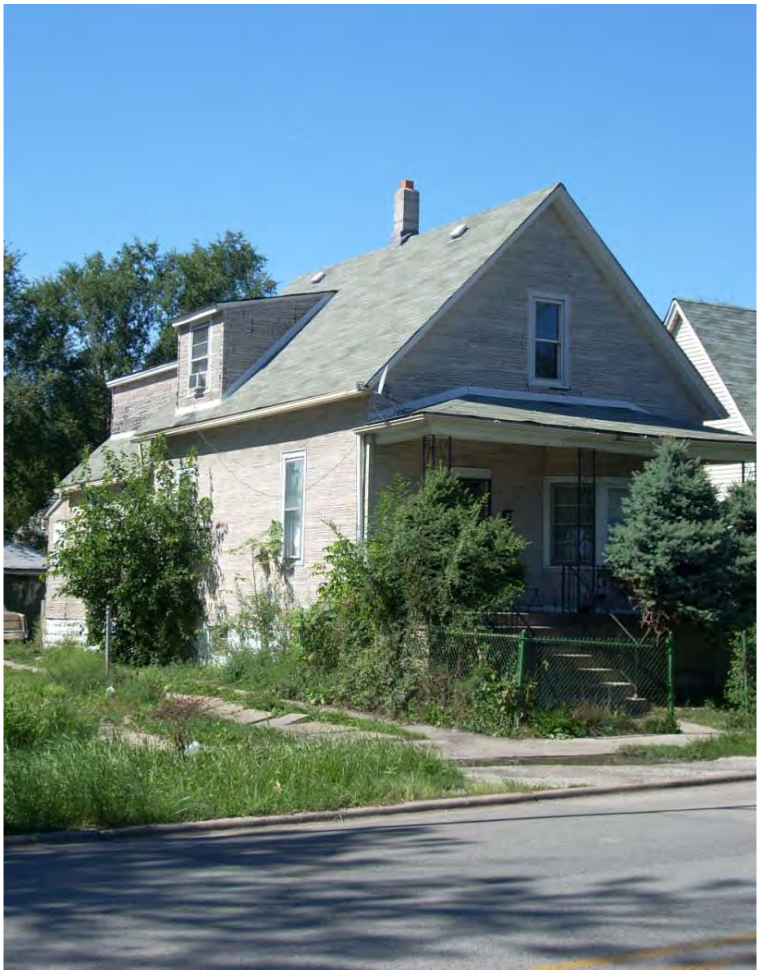
West and south façades of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story house in the West Pullman community is situated on a raised concrete block basement and is clad with synthetic siding. It has a gable roof covered with asphalt shingles and a shed roof dormer on its south elevation. Its front elevation features a full-width, hip-roof, wood porch with open metal railings and posts, an off-center door, a bay window on the first floor, and a single non-original one-over-one window in the gable. This house lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

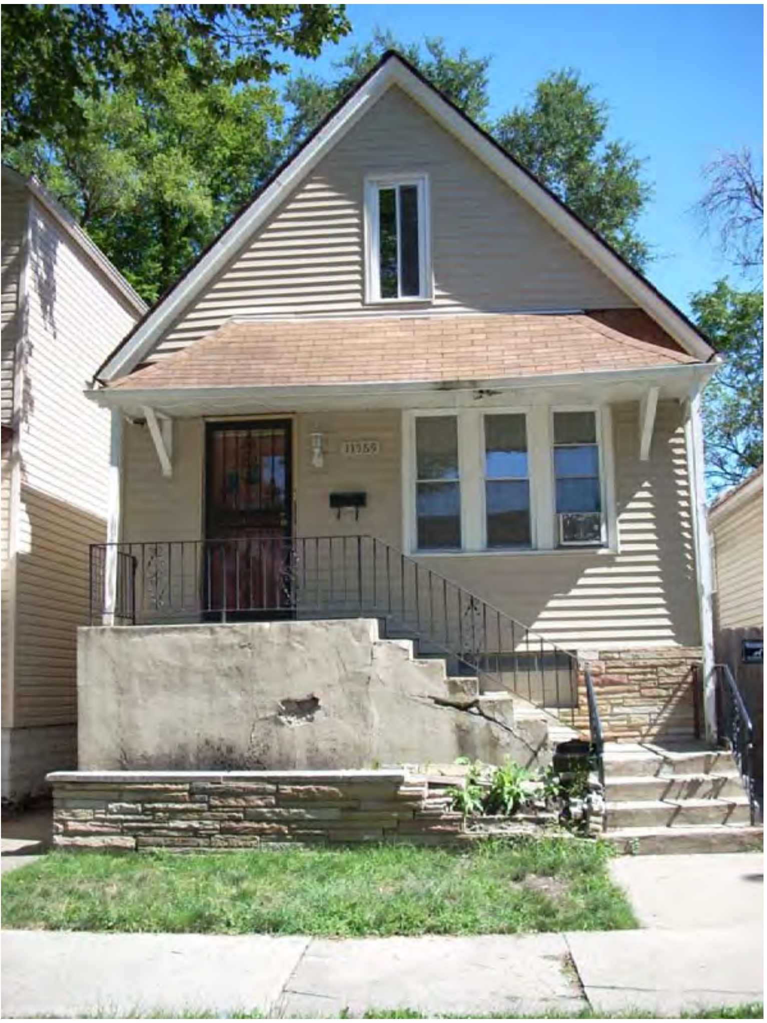
West façade of one-story, single-family, frame residence.



Property Description: **Stories:** 1

This one-story house in the West Pullman community is situated on a raised concrete block basement with a stone veneer. Above, it is clad with aluminum siding and has a gable roof covered with asphalt shingles. Its front elevation features a pent roof with decorative knee braces, an off-center door, concrete steps with metal railings and a strip of three non-original one-over-one windows. The window opening in the gable contains a pair of narrow casements. This house lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

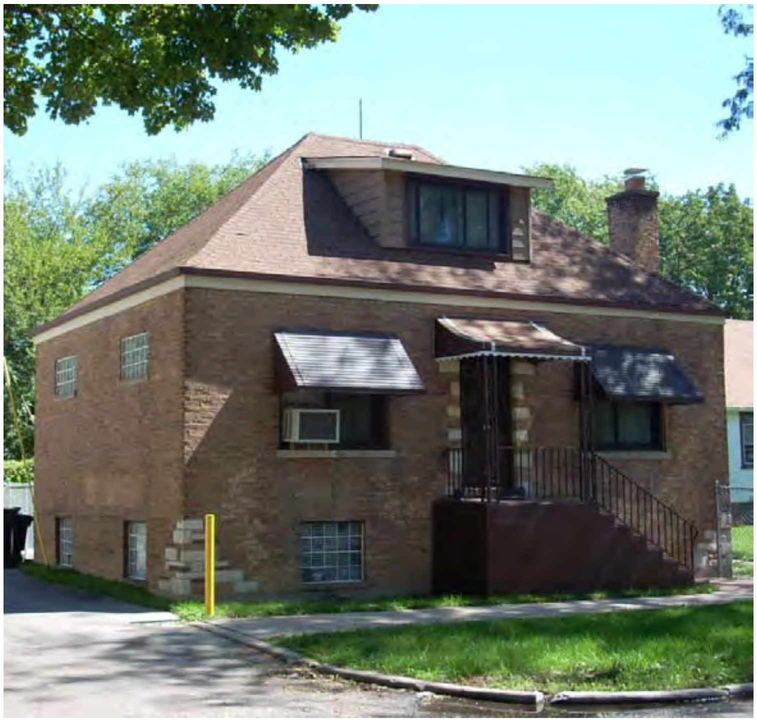
South and east façades of single family, brick residence.



Property Description: **Stories:** 1

This one-story house in the West Pullman community is situated on a raised basement with glass block windows and is clad with common brick. It has a steeply pitched hip roof covered with asphalt shingles and a shed dormer with sliding glass windows. Its front elevation features a centrally located hollow metal paneled door (non-original) flanked by paired, double-hung windows. The porch has concrete steps, metal railings and supports, and a metal canopy roof. Detailing includes rusticated stonework at the basement corners and around the door. This house does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

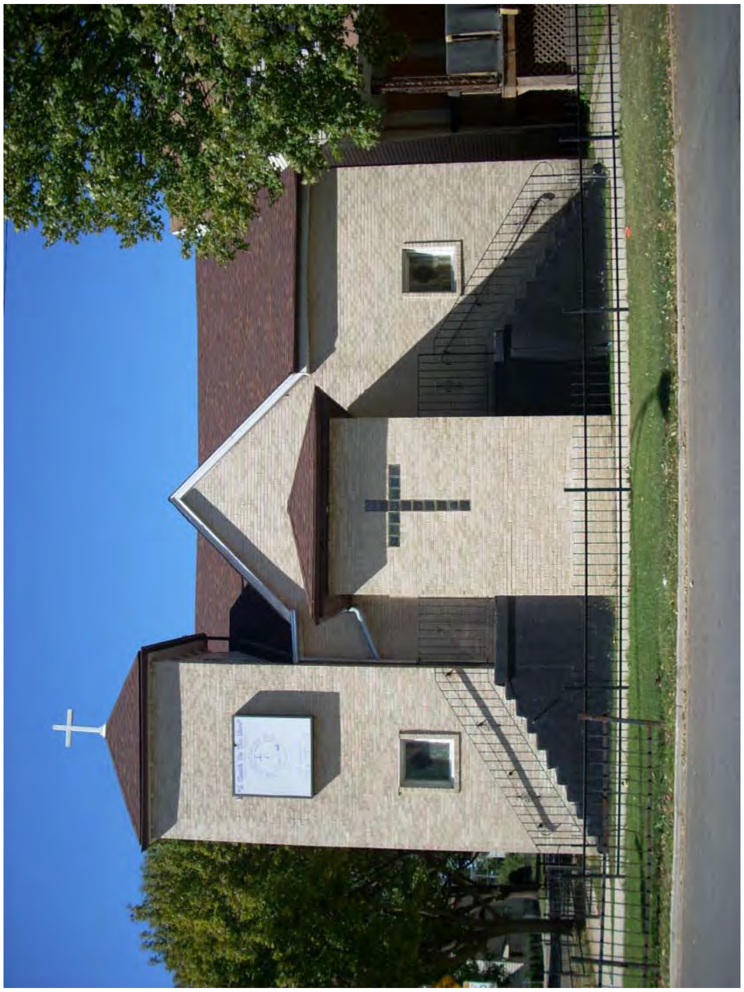
East façade of a brick, 1.5-story religious building.



Property Description: **Stories:** 1.5

This church at the corner of State and 116th streets is clad in buff face brick on a concrete block foundation. The building has a raised basement, gable roof covered with asphalt shingles, and a square corner tower with a hip roof. Its front (State Street) elevation has a centrally located hip-roof entrance pavilion with metal stairs on both sides and a gable wall dormer above. The pavilion features a cross of glass blocks and the flanking walls each have a single square leaded glass window. The side (116th Street) elevation features one large and two small pointed arch windows. This church lacks sufficient distinctive architectural features to qualify as individually eligible for listing on the National Register.

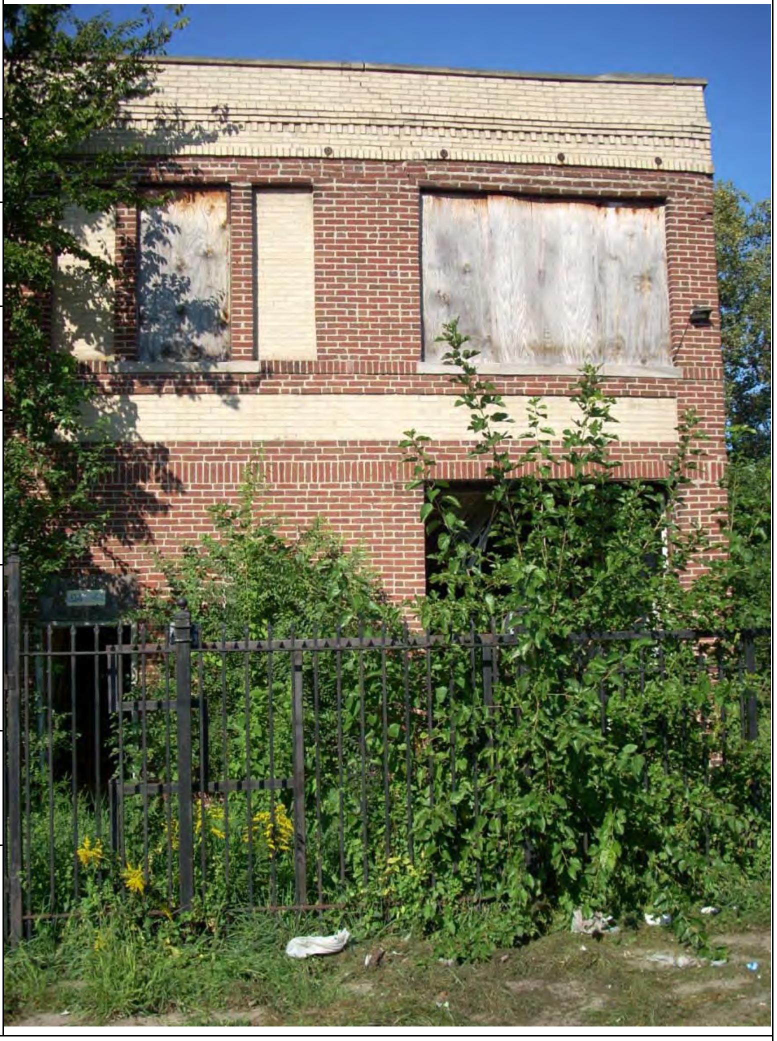
East façade two-story, brick light industrial building.



Property Description: **Stories:** 2

This two-story light industrial building is clad with face brick and common brick along its front and side elevations, respectively, and has a flat roof and parapet. The front elevation has an off-center entrance with no door, a large window opening on the first floor that is obscured by foliage, and window openings on the second floor that have been in-filled with both wood and brick. The buff brick between the first and second floors and at the parapet level contrasts with the red brick cladding of the front elevation and may be non-original. Detailing includes dentil molding on the parapet, banding in brick, and stone sills. Side elevation windows are in-filled with glass block. This building lacks integrity and architectural distinction and is not individually eligible for listing on the National Register.

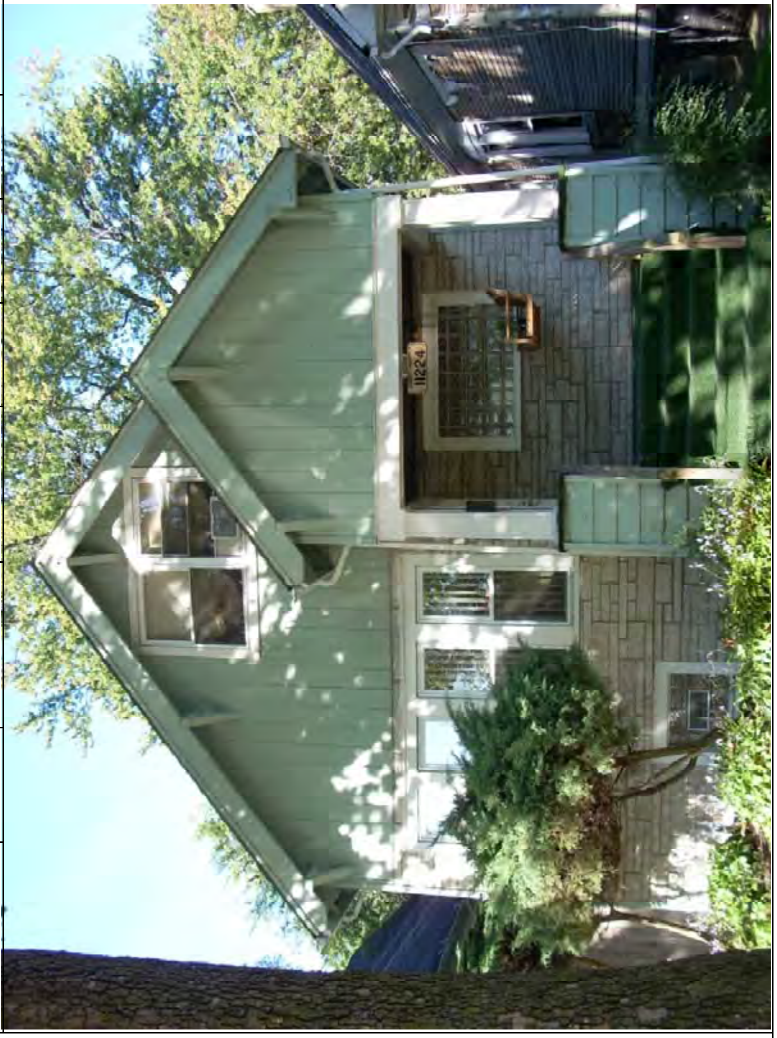
East façade of 1.5-story, frame, single family residence.



Property Description: **Stories:** 1.5

This 1.5-story house in the Roseland community is situated on a raised brick basement with glass block windows. The building has a front gable roof covered with asphalt shingles and overhanging eaves with decorative knee braces. The front elevation is covered with faux stone to the top of the first floor windows and in vertical synthetic siding above. It has a partially recessed gable-roofed corner porch with sidewalls covered with synthetic siding, two low squared wood column supports, and wood steps. A glass block window and hollow core metal door are tucked into one side of the porch. A strip of four windows on the first floor and a pair of windows in the gable are non-original one-over-one aluminum-sash. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

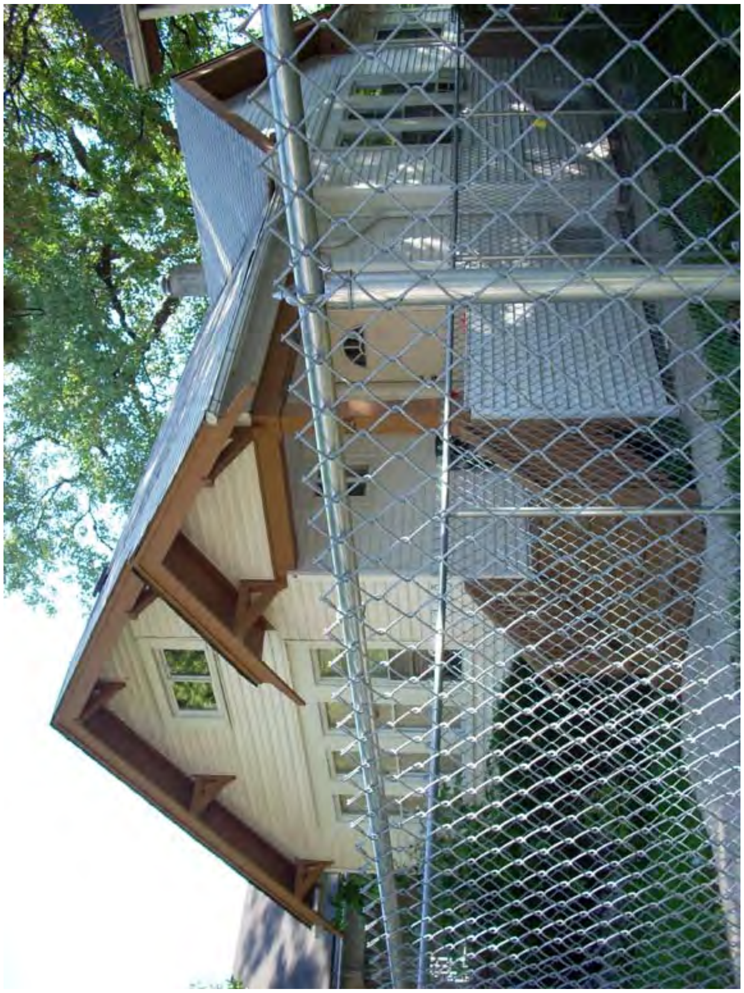
West façade of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman style bungalow in the Roseland neighborhood is clad with aluminum siding. It has a cross-gable roof covered with asphalt shingles, overhanging eaves, extended rafter ends, and decorative knee brace supports. Its recessed corner porch features wood steps, a wood post, a paneled hollow core metal door with fanlight, and a decorative gable hood with knee brace supports. Its front façade has a strip of four one-over-one windows and a pair of single-pane windows in the attic gable that may be casements. This home does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

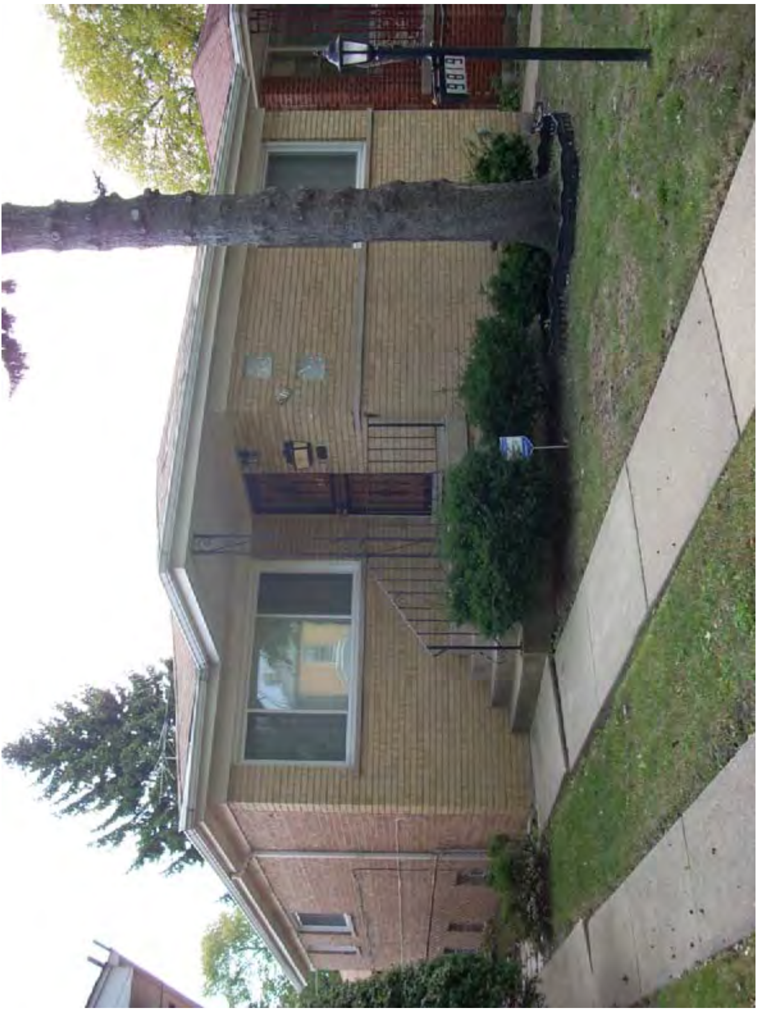
West façade of one-story, single family, brick residence.



Property Description: **Stories:** 1

This one-story house in the Washington Heights community is situated on a raised basement and is clad with yellow face brick on its front elevation and in common brick along its side and rear elevations. The building has a hip roof covered with asphalt shingles. Its front elevation has a door tucked into the side of the projecting living room bay and a partial-width porch with concrete steps, metal railings and an open metal post that is sheltered by the wide roof overhang. Front elevation fenestration consists of a picture window flanked by casements and a pair of windows that are either sliding glass or casement. Detailing includes a concrete sill course and two decorative glass blocks. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

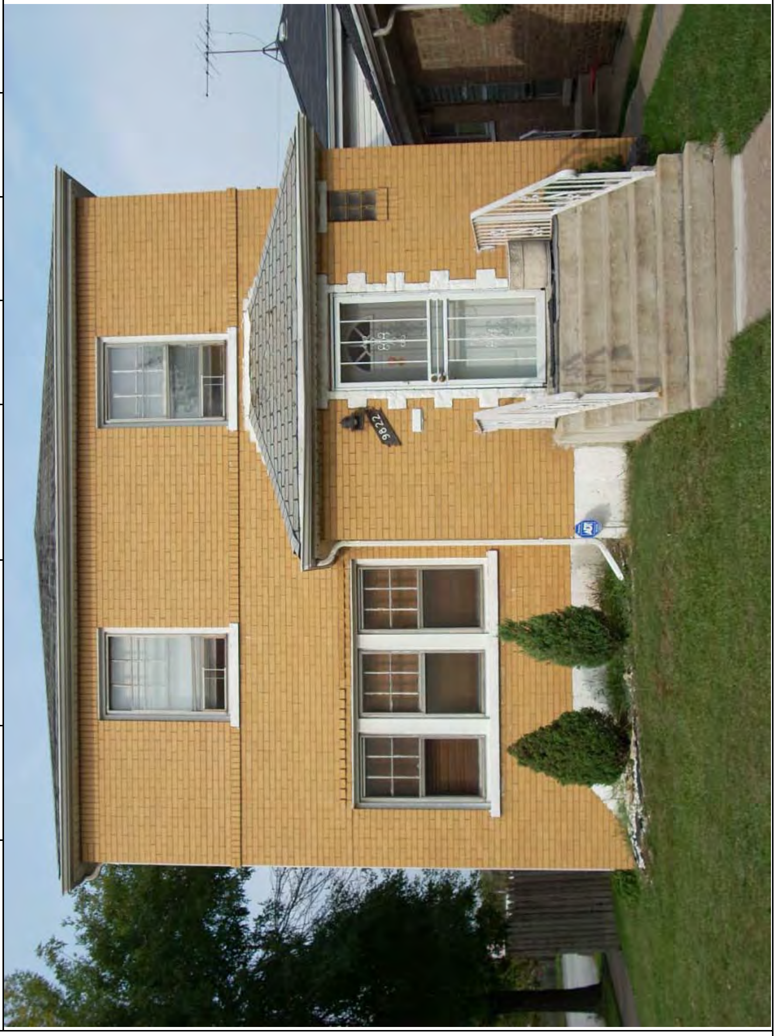
East façade of two-story, brick, single family residence.



Property Description: **Stories:** 2

This two-story house at the northwest corner of Union Avenue and 98th Place in the Washington Heights community is situated on a raised basement and is clad with yellow face brick on its front elevation and in common brick along its side and rear elevations. The building has a hip roof covered with asphalt shingles. Its front elevation has a partial-width, hip-roof, enclosed porch with a non-original hollow core metal door, concrete steps with metal railings, and five six-over-one original wood-sash windows: a strip of three on the first floor and two on the second floor. Detailing includes decorative stone flanking the front door, a small glass block window, brick banding, and concrete sills. This is a standard type of home that was produced during the post-World War II era. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

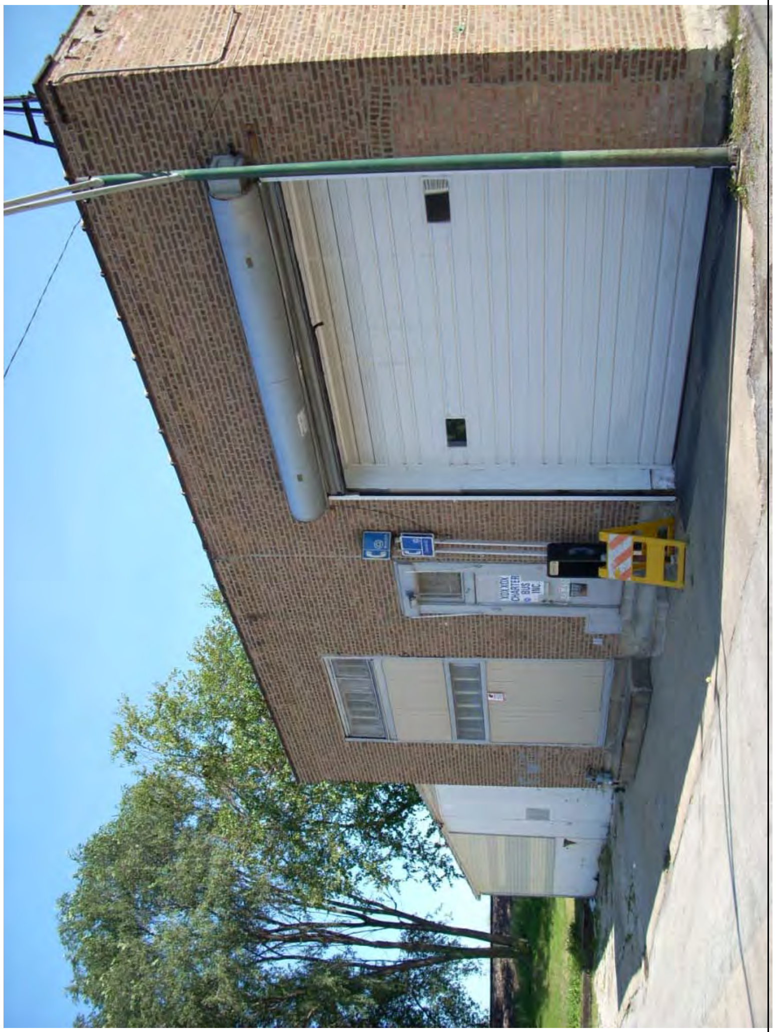
East façade of brick bus garage building.



Property Description: **Stories:** 1

This one-story former warehouse in the West Pullman community is clad with common brick and has a flat roof, parapet, and a shed-roofed frame wing. Its front façade features the outline of an original door opening that has been in-filled with brick, a non-original overhead metal door, a metal door with transom, and a former door opening that has been in-filled with wood panels and two horizontal strips of small fixed-pane windows. One of the side elevations displays the outlines of former window openings that have been in-filled with brick while the other features an overhead metal garage door. This building does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Name **Historic:** Bldg. not labeled, not in CHRS **Common/Current:** Unknown	**Photos with Captions:** East façade of a one-story, single family, frame residence. Property Address: 9912 S. Wallace Street	
HAARGIS Number: Not in database	
Present Owner and /or Occupant: Unknown	
Property Use **Historic:** Single family residence **Current:** Single family residence	
Date of Construction: 1922 **Architect's Name:** Not in CHRS **Builder/Contractor:** Not in CHRS	
Architectural Style: Vernacular	
Prepared By: J. Martinez, M. C. Bird, J. Guarino **Photo By:** S. Katz **Date:** 29 October 2012	

Property Description: **Stories:** 1

This one-story cottage in the Washington Heights community is covered with synthetic siding and has a front gable roof covered with asphalt shingles and overhanging eaves. The front elevation has a partial-width, synthetic-clad, gabled entrance vestibule with a metal storm door topped by a metal awning and wood steps with straight wood railings. There are five non-original one-over-one aluminum-sash windows, including a strip of three in the living room that are partially obscured by a metal awning, and one each flanking the door. There is a pair of one-over-one aluminum-sash windows in the gable. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

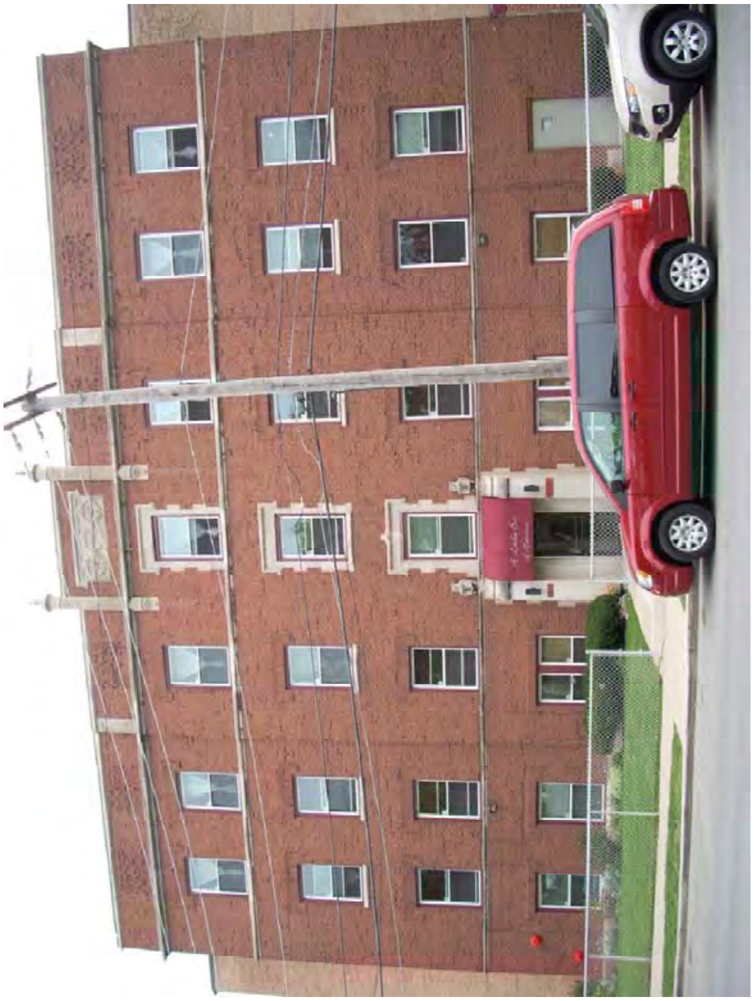
West façade of the four-story, brick building



Property Description: **Stories:** 4

This four-story building at the northeast corner of Wentworth Avenue and 113th Place in the Roseland community has a flat roof and parapet. Its symmetrical front (Wentworth Avenue) elevation is clad with brown face brick and has a centrally located entrance with a glass door and stone surround topped by two stone owls holding books. Windows are non-original one-over-one aluminum-sash; those directly above the entrance have stone casings. Detailing includes stone sills, coping, insert blocks, sill courses, cornice, panels, and pinnacles at the parapet level.

This building is recommended locally significant for National Register listing under Criterion A for Education. Formerly the Roseland Community Hospital Nurses Home, it was built by the hospital as a dormitory and educational facility for its nurses. Closely affiliated with Roseland Community Hospital, which has served as an important institution in the Roseland area since its establishment in 1924, the Nurses Home is an excellent example of this building type on Chicago's South Side. The exterior of the building has very good integrity and the interior—which now functions as a homeless shelter—appears to retain classrooms and other spaces associated with its original use.

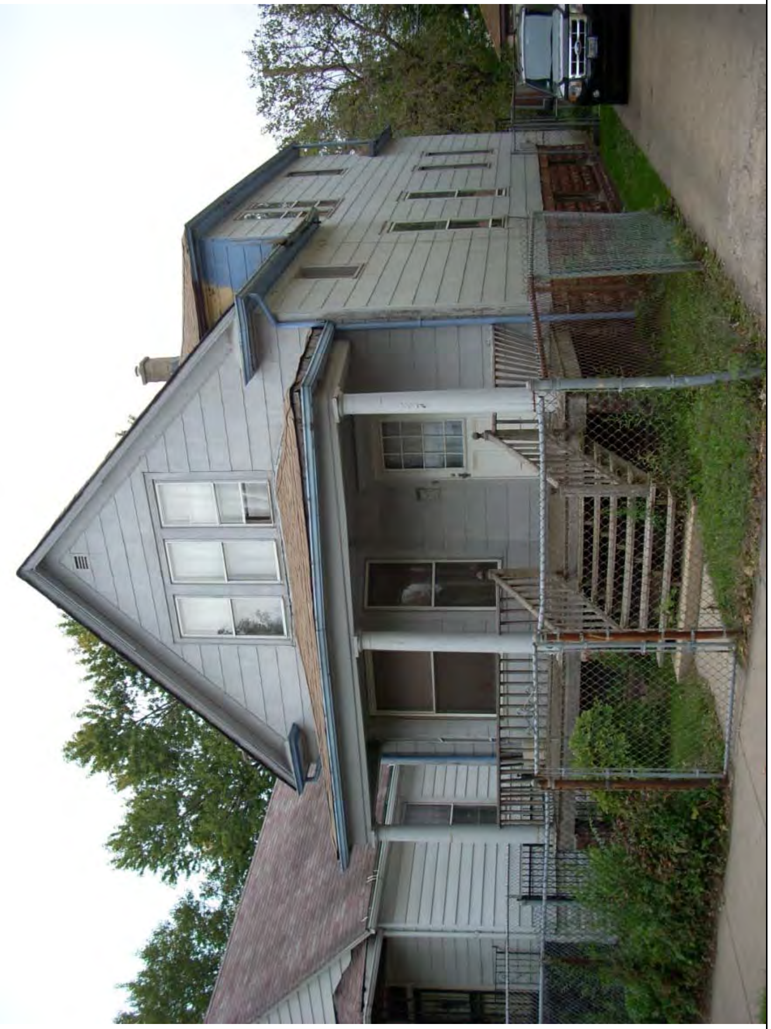
East and north façades of 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame cottage in the Roseland community is situated on a raised concrete block basement with casement windows and is covered with synthetic siding. The building has a gable roof with asphalt shingles. The front elevation has a hipped-roof wood porch with Doric columns, an off-center entrance with a hollow core metal panel door, a three-sided bay window on the first floor, and a strip of three windows in the gable. With the exception of the basement, windows are non-original one-over-one aluminum-sash. The north elevation has a hipped-roof wall dormer. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

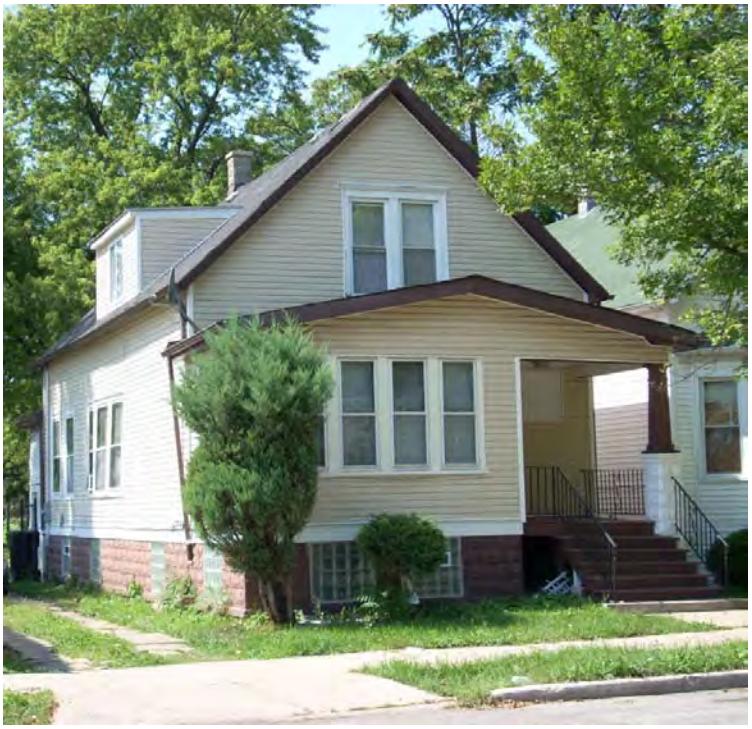
East façade of 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story home in the Roseland community is clad with synthetic siding, has a gable roof covered with asphalt shingles, has a flat-roofed dormer along one of its side elevations, and is situated on a raised concrete block basement with glass block windows. Its front elevation has a full-width gable roof porch, a portion of which is enclosed with synthetic siding and features a strip of non-original one-over-one windows. The open portion of the porch has a corner support consisting of a low faux stone pedestal topped by a wood Doric column, a window opening that has been covered, wood steps, and metal railings. A pair of non-original one-over-one windows with original wood casing is situated in the gable. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

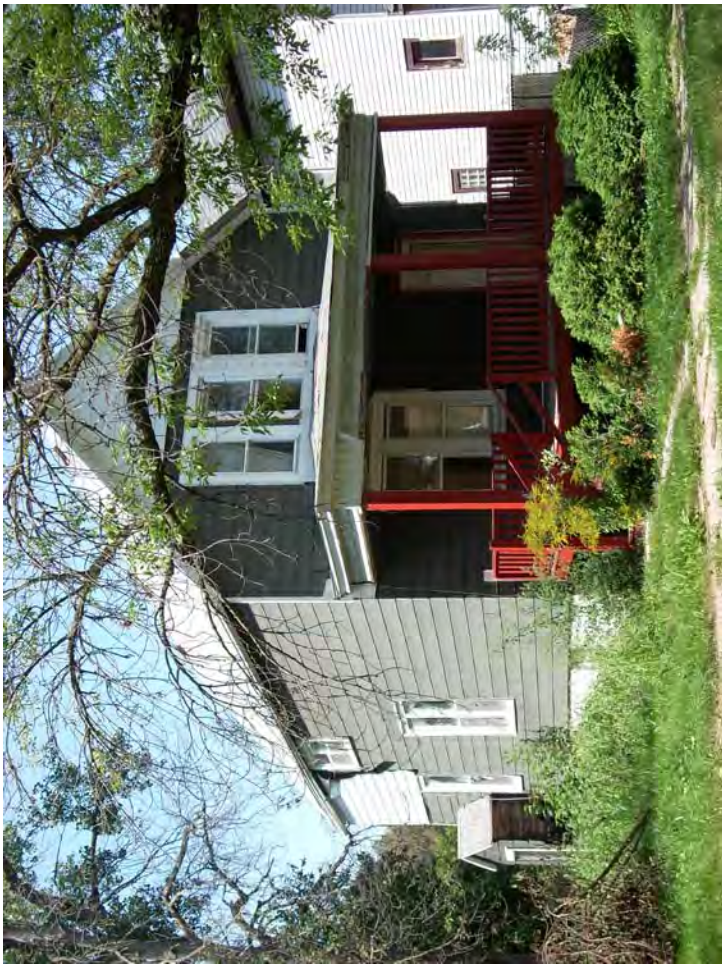
East façade of 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-one-half-story home in the Roseland community is situated on a raised basement and clad in two layers of synthetic siding. It has a gable roof covered with asphalt shingles and a full-width, hip-roof wood porch with non-original, wooden, square columns and rails. The front façade has an off-center, non-original, hollow metal core panel door with fanlight. It also has a three-sided window bay on the first floor comprised of non-original one-over-one windows and a strip of three, non-original one-over-one windows on the second floor. One of the side elevations has a three-sided bay window and gable wall dormer above. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

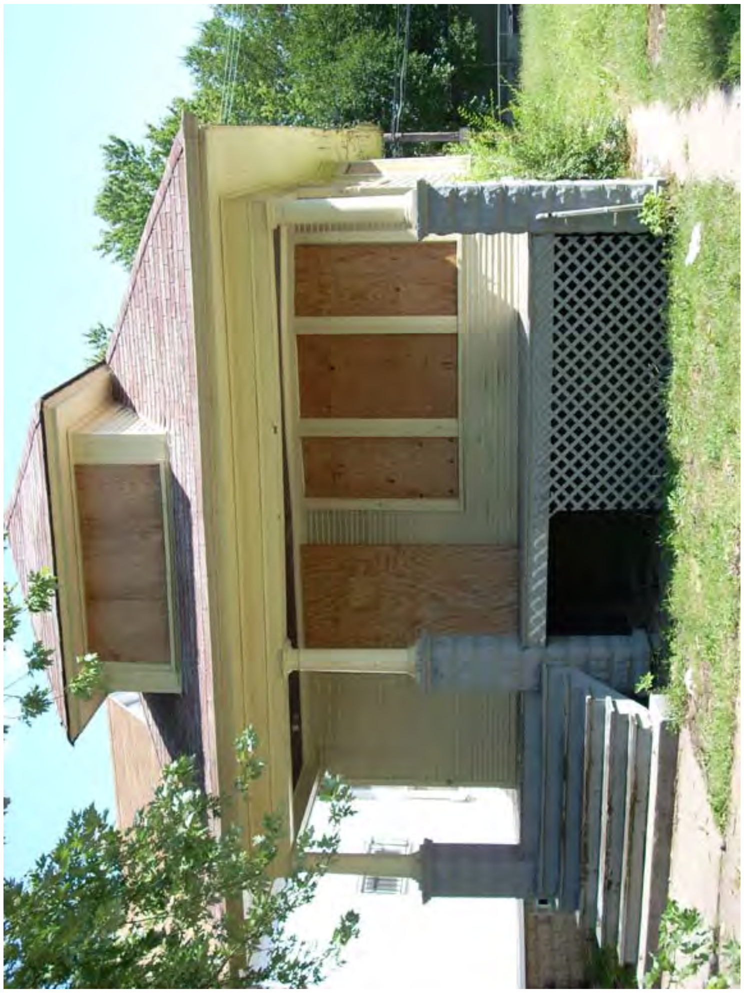
West façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman bungalow in the Roseland community is situated on a raised concrete block basement with glass block windows. Above, it is clad with synthetic siding on the sides and clapboards on the front. It has a hip roof covered with asphalt shingles, overhanging eaves, and a hip dormer. The roofline extends forward to shelter the full-width, hipped-roof, wood porch that is supported by low faux stone pedestals topped by squat wood Doric columns. The front elevation has an off-center door opening and a three-sided window bay. The door and all window openings have been covered with plywood. This building does not have sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story Craftsman style bungalow in the Roseland community is situated on a raised concrete block basement and is clad with synthetic siding. It has a hip roof covered with asphalt shingles and a hip dormer with a pair of single-pane or sliding windows. Its roof overhangs to shelter the full-width wood porch with supports consisting of faux stone pedestals topped by squared wood columns. The front façade has an off-center front door, an adjacent single-pane window, and a strip of four double-hung windows. Windows appear to be original wood-sash. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story cottage in the Roseland community is situated on a raised brick basement with glass block windows and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. Its front elevation has a full-width porch with a mansard-like roof that is partially enclosed and covered with synthetic siding. This elevation of the porch also has a strip of three non-original one-over-one aluminum sash windows. The open portion of the porch has a metal storm door, concrete steps with metal railings, and an open metal corner post. A pair of non-original one-over-one aluminum-sash windows is situated in the gable. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

MEETING NOTES

RE: **Section 106 Kick-off Meeting**
Red Line Extension EIS

DATE: **October 24, 2012**

LOCATION: **Conference Call/Webinar**

TO: **Distribution and All Attendees**

ATTENDEES:

Name	Organization
Sonali Tandon	CTA
Reggie Arkell	FTA
Anne Haaker	IHPA (SHPO)
Jonathan Fine	Preservation Chicago
Terry Tatum	Chicago Historic Preservation Division
Lisa DiChiera	Landmarks Illinois
Erma Tranter	Friends of the Park
Helene Kornblatt	CWC Transit Group
John Mettille	CWC Transit Group
Rebecca Thompson	CWC Transit Group
Robert Ball	CWC Transit Group

PREPARED BY: Rebecca Thompson

ISSUE DATE: October 24, 2012

Meeting called to order at 1:00 pm CT

Objective: Red Link Extension Kickoff Meeting for Section 106 Consultation

Item No.	*Item Description*	*Responsibility*	*Due Date*
1	**Welcome/Intro** Sonali welcomed attendees and callers introduced themselves.		
2	**Overview of Section 106 Process** John Mettille provided an overview of the four-step Section 106 process. Reggie Arkell explained that FTA is overseeing the consultation process, working in conjunction with CTA. FTA will make determinations regarding eligibility and effects, referencing recommendations prepared by the consultant and considering input from consulting parties, including the SHPO. John discussed the roles of consulting parties and identified ground rules to ensure everyone has a fair chance to provide meaningful input.		

Item No.	*Item Description*	*Responsibility*	*Due Date*
3	**Project Info & Alternatives** Sonali provided a brief overview of the project area, the No Build alternative, and the three Build alternatives that are being considered: UPRR rail, Halsted rail, and Bus Rapid Transit. John presented the Area of Potential Effects (APE), which defines the geographic boundary where the analysis of historic resources will occur. A larger scale APE map is attached to the meeting summary.		
4	**Schedule/Next Steps** John explained the next steps in the process. Work is underway to identify potential historic properties. We are tentatively planning to hold a meeting to discuss the eligibility of resources in December. A meeting to discuss effects will occur in early 2013.		
5	**Question/Answer** - Jonathan: Is the purple segment on the alternatives map new or existing? It would be a new structure in the median of the expressway. - Reggie: What is the pier spacing for the Halsted Alternative? Spans between piers would typically be 60 to 100 feet, and as long as 140 feet. Span length would be based on site conditions, geometrics, and clearance requirements. - Jonathan: What advantages does the Halsted Alternative offer over the No Build Alternative? Halsted would extend the red line south to serve additional transit markets. The No Build Alternative includes improvements at the 95th Street station which are currently being planned but would not include an extension of the route or other improvements. - Jonathan: Which alternative has the least impacts on historic resources? That is part of what we will determine through this process. - Lisa: Is documentation of the previous study available online? Yes, the project website is http://www.transitchicago.com/redeis Please use following links to access specific materials: Locally Preferred Alternative Report and Scoping Report (http://www.transitchicago.com/Redeis/documents.aspx); Alternatives Analysis Materials (http://www.transitchicago.com/news_initiatives/planning/redextend.aspx) - Lisa: If we have additional information about resources, should we send it to the team? Yes, please direct it to Sonali at STandon@transitchicago.com. - Erma: Are parks covered in the 106 process too? Parks are protected under Section 4(f) regulation, which is a separate law; they will be addressed in the project EIS. The Section 106 process will deal with historic resources; if any parks in the area or park facilities are determined to be historic, they will be considered during the 106 process. If any historic resources are used by the project, they will be addressed under Section 4(f) as well. Parks that are not historic are subject to the 4(f).		

Please notify the author of the minutes of any corrections and/or clarifications within five (5) business days.

PREPARED BY: Rebecca Thompson

ISSUE DATE: January 31, 2013

Meeting called to order at 10:30 am CT

Objective: Red Link Extension Eligibility Meeting for Section 106 Consultation

Item No.	*Item Description*	*Responsibility*	*Due Date*
1	**Welcome/Intro** Sonali welcomed attendees. Reggie Arkell explained FTA's oversight role on the project. John Mettille reviewed the agenda.		
2	**Background & Regulations** John Mettille provided an overview of the four-step Section 106 process, which is intended to assess historic resources and their eligibility for listing on the National Register of Historic Places (NRHP). John identified ground rules to ensure everyone has a fair chance to provide meaningful input.		
3	**Review of Area of Potential Effects (APE)** John presented the APE, which defines the geographic boundary where the analysis of historic resources will occur. The area includes over 1,400 acres and 7,000 buildings.		
4	**Methodology for Identification of Historic Properties** The team developed historic contexts for each community in the APE to frame the evaluation of historic properties. The team also conducted field surveys and archival research for over 500 individual properties within the APE. The survey sample included all buildings that would be demolished by one or more alternatives and a sample of other properties; sample properties were concentrated in areas that are likely to experience greater effects. Based on this, eligibility recommendations were developed for individual properties. - Q: Did you look at properties less than 50 years in age that could be significant to the community? A: We primarily examined properties over 50, but we did look for overall significant properties as well as potential historic districts. - Q: Are Chicago Historic Resources Survey (CHRS) red/orange properties shown? A: They are noted in the summary table in section 3 of the handout packet. - Q: What research was done on the social history of the area? For example, what about identifying community meeting places or locations significant in the lives of civil rights leaders? Of the 7,000 buildings in the APE, it is concerning that only 10 are identified as eligible.		

Item No.	*Item Description*	*Responsibility*	*Due Date*
	A: The team developed historic contexts for each of the communities represented in the APE but these focused primarily on the built environment. Part of the intent of the consultation process is to gather your input about what additional resources are out there, particularly from organizations more familiar with the immediately vicinity and social history. If you have information about potentially significant resources, please let us know during the comment period.		
5	**Overview of Surveyed Properties** Nine properties were recommended eligible for NRHP listing. - Residence at 444 W 100th Place - Former substation at 10227 S Halsted Street (gas & electric for the city) - Fire Department at 324 W 104th Street - Roseland Pumping Station (still in use) - Residence at 11310 S Emerald Avenue - Church at 10920 S Princeton Avenue (currently Mary Magdalena Missionary Baptist Church) - Fire Department at 931 W 120th Street - Church at 12433-12439 S Halsted Street - Venetian Hall at 133-139 E Kensington Avenue (currently used as church and shelter) *Note: the address is correct but the property lies in the West Pullman community.* In addition, Altgeld Gardens was determined NRHP eligible in 1992 independent of the project. - Q: How do you account for the fact that the community is under surveyed and underserved? Underrepresentation undercuts the intention of the project. A: The team prepared historic contexts for each community, consistent with the state of the practice. Beyond that, we rely on your input. Once you provide your comments, the team will establish a strategy to move forward. We will respond to comments received and keep you informed. - Q: Does the list of surveyed properties fully cover the area to be considered in the historic/social context? (DCP agreed that it does not.) A: The APE covers the area that could be impacted by the project; it forms the limits for our analysis. - Q: Is there a separate involvement process for Section 4(f)? A: There is a public involvement element if these resources are affected. It isn't a committee, but there is a mechanism to gather input from agencies and others. - Kensington Park along the UPRR corridor should be added to the table on slide 29. *Note: information for Fernwood Parkway was included in the table although the name was mistakenly presented as "Fernwood Park" instead. Wendell-Smith Park is presented as "Smith Playlot" in the table, consistent with the Chicago Parks Department naming convention.*	CWC	3/1

Item No.	***Item Description***	***Responsibility***	***Due Date***
6	**Schedule & Next Steps** John Mettille reviewed the schedule and next steps. - Q: Can you describe the effects for each eligible property? A: We will cover this in the next phase of the process, probably in Spring 2013. - Q: What is the third alternative shown? A: The Halsted Alternative was added during the scoping process to look for options to minimize the impacts on parks and other 4(f) resources. The UPRR Alternative is the locally preferred alternative; we will define a National Environmental Policy Act (NEPA) preferred alternative as part of the NEPA process. - Q: Can the UPRR alternative fall anywhere inside the APE boundary? A: No, it will follow or run adjacent to the existing UPRR alignment. The APE includes a buffer to account for visual, noise, and other indirect effects. - Q: What source did you use for the architects and construction dates? A: CHRS and the County Assessor website. - Two of the photos on slide 26 could be considered contributing within a district. There are enough "Ranchalows" that they could be considered a housing style. The team will provide a full survey map and consulting party list as requested by attendees. Materials will be revised to clarify that properties referenced in Riverdale lie in the Riverdale Community in Chicago rather than Riverdale, Illinois. Please submit written comments on the eligibility materials by February 18.	CWC/CTA	2/6

Following the morning presentation, a number of attendees participated in a driving tour of the project area. Please notify Sonali Tandon of the minutes of any corrections and/or clarifications within five (5) business days.

cc: Attendees

Red Line Extension (RLE) Summary of Eligibility Comments received from Consulting Parties and Responses from Project Team

The following paragraphs briefly summarize comments received from the consulting parties on the eligibility of historic resources for the RLE Project and corresponding responses from the project team. Under the Section 106 consultation process, CTA undertook an extensive data collection and analysis effort during Fall 2012 to identify historic resources located within the Area of Potential Effect (APE) for the three built alternatives that are under evaluation in the RLE Draft Environmental Impact Statement (EIS). This analysis culminated in recommendations regarding the potential eligibility of historic resources pursuant to the National Historic Preservation Act of 1966. These recommendations were presented to the ten consulting parties, including the Illinois Historic Preservation Agency (SHPO), during a meeting on January 30, 2013. Participants were asked to provide relevant information from their perspective that may supplement the National Register of Historic Places (NRHP) evaluations contained within the RLE Draft EIS. Written comments were received from the following six organizations:

- Anne Haaker, Illinois Historic Preservation Agency
- Jennifer Kenny, Ridge Historical Society
- Jonathan Fine, Preservation Chicago
- Lisa DiChiera, Landmarks Illinois
- Matt Cole, Neighborhood Housing Services of Chicago
- Terry Tatum, Chicago Historic Preservation Division, Department of Housing and Economic Development

Based on local knowledge and input from the consulting parties, additional analysis was undertaken regarding historic resources within the APE. The original recommendations presented in January will be revised as described below and presented in the RLE Draft EIS. In addition to the written comments received by CTA, comments from the January 30 meeting will also be incorporated into the Draft EIS to provide additional clarification. Comments and responses are presented by general topic below.

Comments requesting additional surveys:
Several comments requested that the team evaluate additional sites for NRHP eligibility. These additional sites and their evaluations are summarized below, including both individual properties (Comments #1-6) and potential districts (Comments #7-12).

1. American Ideal Cleaning Building at 10343 South Michigan Avenue
   This building falls beyond the APE boundaries.
2. Lilydale Progressive Missionary Baptist Church at 10716 South Michigan Avenue
   This building falls beyond the APE boundaries.
3. Greystone building at 11445-11447 South Michigan Avenue
   This building falls beyond the APE boundaries.
4. Entrance gate and structure at Cedar Park Cemetery at 12584 South Halsted Street
   These structures were field surveyed in February 2013 and are recommended eligible for the NRHP under Criterion C for the high quality craftsmanship and unusual stonework. A site form is attached.

5. Kensington Park
   The Park was field surveyed and, following archival research is not recommended eligible for the NRHP. Purchased by the City in 1942, Kensington Park has been updated throughout the decades and currently contains a number of contemporary recreational amenities that give it a recent appearance: a mid-twentieth century field house that is no longer in use, playground equipment, a splash pad, a paved basketball court, a horseshoe pit, and baseball fields. Although the field house is over 50 years in age, it lacks distinguishing architectural features. As a publicly-owned park, Kensington Park will be addressed in the NEPA document as a Section 4(f) resource.
6. Two-story commercial building at 11206 South Michigan Avenue
   The building was surveyed and is not recommended eligible for the NRHP due to its lack of integrity and distinguishing architectural features. The site form is included on the Eligibility CD as 11200-11206 S Michigan Avenue.

Note: A number of sources consulted during the archival research phase – including the City of Chicago GIS database, Illinois Historic Preservation Agency's HARGIS database, County Assessor Records, and others – present building addresses inconsistently. Street numbers may differ by several addresses: the church at 12433-12439 South Halsted Street is called 12427 South Halsted Street by a different agency, though both refer to the same building. To aid comparisons, the summary table notes alternate addresses for several properties when these inconsistencies were identified during the eligibility assessments.

7. Potential historic district/grouping of cast stone-faced residences on South Eggleston Avenue between 111th & 112th Streets
   Numerous buildings in this location were surveyed as part of the representative sample set, including one cast stone-faced residence on South Eggleston Avenue (11130 South Eggleston Avenue). Individually, this building was not recommended eligible for the NRHP due to its lack of integrity and distinguishing architectural features. Along South Eggleston Avenue near West 111th Street and West 112th Street, there appear to be only two cast stone-faced residences within the APE, which is not sufficient for these properties to be considered as a potential historic district or multiple property grouping.
8. Could groupings of ranchelows contribute to a future NRHP district (between 103rd St, 104th Pl, UPRR, and Princeton Ave)?
   A number of raised ranches were surveyed as part of the representative sample set; none were found to merit individual listing for the NRHP. Although the area (between 103rd St, 104th Pl, UPRR line, and Princeton Ave) contains numerous residences with similar architectural styles, massing, setbacks, and construction dates, architectural historians confirmed that these properties do not retain sufficient integrity for the NRHP as a district due to contemporary -alterations (e.g., replacement siding, porches, windows, and doors). Numerous vacant lots and recent construction, such as the post-1980 Langston Hughes Elementary School that encompasses an entire city block, disrupts the visual cohesiveness of this area.
9. Potential district of Residential Railroad Suburbs or Historic Streetcar Communities, e.g. along the Chicago & Eastern Illinois RR; the Chicago & Great Eastern RR; the Illinois Central RR 121st Street spur; or streetcars along Michigan Ave, 103rd St, 111th St, 115th St, and 119th St.
   After additional fieldwork, no cohesive groupings of historic commercial buildings or community centers were identified along the primary thoroughfares that supported streetcar lines, railroad

lines, or spurs. Therefore, the suggested areas are not recommended as a district or multiple property group.

10. Potential district/group of properties associated with the former Village of Fernwood, generally located between 90th St, 103rd St, Stewart Ave, and Morgan/Halsted Street
    As part of the original fieldwork effort, a handful of these resources were surveyed within the APE. As noted in the letter, many have integrity issues. Many of Fernwood's signature buildings are located outside the APE or have been demolished. Further, the amount of contemporary infill has compromised the historic setting of the residential suburb. Therefore, this area is not recommended as a district or multiple property group.
11. Potential district/group of historic automobile-related buildings along major thoroughfares (e.g. Halsted and Michigan Ave)
    Although a number of auto-related resources were surveyed within the APE, none exhibited sufficient historic integrity to qualify as eligible for the NRHP either individually or as a contributing resource within a multiple property group. All of the surveyed automotive service buildings exhibit contemporary alterations.
12. Chicago Georgian and Raised Ranch Historic Districts
    The Ridge Historical Society and other consulting parties suggested these styles be considered as part of the eligibility discussions for the Section 106 process. Review by architectural historians confirmed that a cluster of these properties exists along an approximately five block area on the east side of Green Street between 104th Street and 109th Street. The streetscape has a cohesive grouping of vernacular homes that is representative of residences that were constructed in the outlying areas of Chicago during the post-World War II era. Although such neighborhoods are common throughout the city, these five blocks include hipped-roof ranch homes, front-gabled cottages, and Chicago Georgian style homes with little to no contemporary infill. The residences date from the 1950s and 1960s with consistent setbacks and similar brick cladding; they appear to be well-maintained. Therefore, the portion of Green Street between 104th Street and 109th Street is recommended as eligible for the NRHP as a historic district for architecture (Criterion C).

Comments requesting reconsideration of surveyed properties:
Several comments requested that the team reconsider properties that were surveyed but recommended not eligible for NRHP listing at the January meeting. These additional properties and their evaluations are summarized below.

13. Sure-Way M.B. Church at the southwest corner of Halsted Street and 120th Street
    The building is not recommended eligible for the NRHP due to lack of integrity and because it no longer serves its original use. The site form is included on the Eligibility CD as 12000 S Halsted Street.
14. Fernwood Parkway
    Fernwood Parkway was evaluated against NRHP criteria and is recommended not eligible for NRHP listing. However, as a publicly-owned park, it will be addressed in the NEPA document as a Section 4(f) resource.
15. Roseland Auto Sales & Service at 11200 South Halsted Street
    The building is not recommended eligible for the NRHP due to its lack of integrity. The setting is compromised by contemporary infill and the exterior has been clad in modern materials. The site form is included on the Eligibility CD as 11200 S Halsted Street.

16. Bethany Reformed Church Manse at Three West 111th Place
    The building was not originally recommended eligible due to its lack of distinguishing architectural features. However, as a result of additional information provided by Ridge Historical Society, the resource is recommended eligible for the NRHP under Criterion B due to its association with Reverend Harry J. Hager (1899-1983), a pioneer in media evangelism in Chicago during the mid-twentieth century. A revised site form is attached.
17. Pridjian & Co Building at 11600 South Halsted Street
    The building is not recommended eligible due to its lack of distinguishing architectural features. While the Pridjian & Company business has been in operation for decades, the property does not reach the level of significance required by the NRHP. The site form is included on the Eligibility CD as 11600 S Halsted Street.
18. Roseland Community Hospital Nurse's Home at 11321 South Wentworth Avenue
    The building was surveyed and was not originally recommended eligible due to its lack of distinguishing architectural features. However, as a result of additional information provided by Ridge Historical Society during the eligibility discussions for the Section 106 process, the resource could be considered locally significant under Criterion A for Education based on its use as a dormitory for its nurses and as an important nurse training facility. A revised site form is attached.
19. Galloy & Van Etten Cut Stone Contractors Building at 11756 South Halsted Street
    The building was not originally recommended eligible under Criterion C due to its lack of integrity and distinguishing architectural features. However, as a result of additional information provided by Ridge Historical Society during the eligibility discussions for the Section 106 process, the resource could be considered locally significant under Criterion A for its longstanding association with the local construction industry as a 113-year old stone contracting company. A revised site form is attached.
20. Would the substation at 10227 South Halsted Street be eligible under Criterion A as well?
    Yes: the substation is recommended eligible under Criterion A for its association with utilities infrastructure within the city of Chicago. At the January 2013 meeting, it was recommended as NRHP eligible under Criterion C. A revised site form is attached indicating this building as eligible both under Criterion A and Criterion C.
21. Although noted architect Murray Hetherington designed the house at 11001 S Green Street, the resource was only evaluated based on its integrity.
    Numerous residences designed by Hetherington that exhibit greater integrity exist today, including 2078 West Hopkins Place, 8918 South Hamilton Avenue, and 8929 South Hamilton Avenue. Due to the compromised integrity of the Green Street property, it is not recommended as NRHP eligible. The site form is included on the Eligibility CD as 11001 S Green St.

Comments regarding assessment of effects:

The following comments expressed concern about the assessment of effects, which will be covered in the next phase of the consultation process. Noted below, these will be considered in the next phase of the analysis.

22. We object to historic properties being purchased and demolished for construction staging.
23. The proposed BRT route would affect the fewest cultural resources. The UPRR route will affect fewer resources than the proposed Halsted line.

24. Building an elevated rail line down Halsted Street would have negative consequences for the tranquil and bucolic atmosphere of the Cedar Park Cemetery.

Comments requesting minor amendments to the summary table and/or site forms:
The following comments identified minor amendments to the summary table and/or site forms for individual properties. None of these modifications change the NRHP eligibility recommendations. Noted below, these edits will be incorporated; revised materials will be provided along with the effects materials prior to the next phase of the consultation process.

25. The Fire Department Engine Co. 93 building at 324 West 104th Street (alternate address: 328-330 W. 104th St.) is CHRS Orange
26. The Roseland Pumping Station at 351 West 104th Street is CHRS Orange
27. The French Eclectic style house at 11310 South Emerald Avenue was listed as a “local landmark” but is not designated; it is CHRS Orange.
28. The Romanesque Revival style Church at 10920 South Princeton Street is CHRS Orange
29. The two-story commercial building at 11206 South Michigan Avenue is CHRS Orange
30. The architectural firm of Fox & Fox designed the church at 12433-1439 South Halsted Street, which was built in 1958-1959.
31. The Venetian Hall at 133-139 East Kensington Avenue was built in 1925-1926 and designed by Arthur F Hughes.
32. The house at 11310 South Emerald Avenue was built 1927-1928 for Stuart Colman. Inventory form should specify this resource is individually eligible.
33. Property listed as 748 East 103rd Street should be 748 West 103rd Street.
34. The substation at 10227 South Halsted Street was built in 1919-1920.

Other Comments:
Additional comments received are discussed below.

35. There should be a separate category in the spreadsheet for Chicago properties rated as “orange” on the Chicago Historic Resources Survey (CHRS).
    CHRS Orange properties were noted in the summary table provided to consulting parties on January 5, 2013. These properties will be discussed separately within the project’s Environmental Impact Statement.
36. We [SHPO] generally concur with the findings of the architectural surveys. It is expected that additional resources suggested will be considered once the final route is selected.
    Comment noted.
37. While we agree that the house at 444 West 100th Place is NRHP eligible, we disagree about the Neo-Traditional style description and are concerned that the replacement of the original tile roof jeopardizes integrity.
    Based on the ornamentation (Neo-Gothic castellated porch roof, Classical colonettes, and arched lintels), the house was identified as an early example of the Neo-Traditional style. It is recommended as NRHP eligible and will be assessed for effects in the next phase of the consultation process.
38. Use of catch-all architectural style descriptors was inconsistent and difficult to sort/review.
    Many of the residential resources are stripped-down brick and frame bungalows and cottages representing the predominant building stock for the study area. Likewise, commercial resources

contain little ornamentation or detailing. The broad term “vernacular” was used whenever a resource did not exhibit a particular architectural style. This approach is consistent with the current state-of-the-practice.

39. Historic functions should match NRHP categories.
While official NRHP functions were not used on the survey forms, easily identifiable equivalent terms were used to improve comprehension for a broader audience. This approach is consistent with the current state-of-the-practice.
40. Construction dates listed in the Cook County Assessor Records are less reliable than dates listed in building permit records.
Numerous varied sources were used to establish and cross-check construction dates: County Assessor records, GIS database layers provided by the City of Chicago, the HARGIS database maintained by the Illinois Historic Preservation Agency, Sanborn mapping, etc. This approach is consistent with the current state-of-the-practice.
41. The church at 10920 South Princeton Avenue is currently called Mary Magdalene Missionary Baptist Church.
The church at 10920 South Princeton Avenue was identified by both its historic name (First Christian Reform Church of Roseland) and its current name (Mary Magdalene Missionary Baptist Church) on the inventory form. The property is eligible for the NRHP due in part to its association with early Dutch settlement in the area, so the historic name was referenced in the presentation.

CTA
Red Line Extension

February 4, 2013

Sonali Tandon
Chicago Transit Authority
567 W. Lake St.
Chicago, IL 60661-1498

Dear Ms. Tandon:

Thank you for requesting comments from our office concerning the possible effects of the referenced project on cultural resources. Our comments are required by Section 106 of the National Historic Preservation Act of 1966, as amended, and its implementing regulations, 36 CFR 800: "Protection of Historic Properties".

We appreciated information provided during the meeting at the CTA on January 30, 2013, and the tour that augmented the architectural surveys and introduced the three routes proposed by the CTA. In general we concur with the findings of the architectural surveys submitted to this office prior to the meeting and tour, but during the tour is was noted that resources identified on the Chicago Historic Resources Survey were not identified and that structures such as those located within Cedar Park Cemetery were excluded from the sample. It is likely that our preservation partners present at the meeting will have additional resources that they would like to see included in the survey. It is expected that these additional resources will be considered once a final route has been selected.

In our opinion, the proposed expansion of the BRT route will affect the least amount of cultural resources located within its APE. We also believe the UPRR route that is often adjacent to existing railroad tracks will affect fewer resources than the line proposed on Halsted Street.

We look forward to reviewing the final historic resources report once the comments of our preservation partners have been considered.

If you have questions please contact David J. Halpin, Cultural Resources Manger, at 217-785-4998.

Sincerely,

Anne E. Haaker

Subject: Red LIne Extension Section 106 - comments on historic resource identification

Dear Ms. Tandon:

Thank you for the opportunity to comment on historic resource identification efforts for the Red Line Extension Project as part of the ongoing Section 106 consultation process for this project. Our office appreciates the scale and importance of this undertaking, and we commend the CTA's efforts to incorporate historic preservation issues and concerns into its larger planning efforts. We hope to work with you to minimize the effect of the Red Line Extension Project on historic properties.

As part of the Section 106 process, we wish to bring to your attention both general observations on this historic resource identification effort, as well as comments on specific properties that may be impacted by the project.

Chicago Historic Resources Survey red- and orange-rated properties

With the help of your consultant team, you have preliminarily identified properties that are eligible for NR listing. These properties have been listed in the "RLE Draft Eligibility Findings for Surveyed Properties" spreadsheet.

Our office believes that there should be a separate category in the spreadsheet for Chicago properties rated as "orange" on the Chicago Historic Resources Survey. (There are no CHRS "red-rated" buildings in the Red Line Extension's APEs.) Conducted between 1983 and 1995, this city-wide survey identified properties constructed prior to 1940 that were perceived to have, within at least the context of their neighborhoods, some historic significance to these neighborhoods. These buildings were either color-coded red or orange, depending upon the level of their historical and architectural significance as known at the time of the survey.

Although not designated Chicago Landmarks, these CHRS "red" and "orange"-rated properties are covered by the City's Demolition-Delay Ordinance, enacted by City Council in 2003, which allows for an up-to-90-day hold on building permit applications for demolition by the Department of Housing and Economic Development (DHED) for these properties. (More information on this ordinance can be found at http://www.cityofchicago.org/city/en/depts/dcd/supp_info/demolition_delay.html.) Even where such properties have also been determined eligible for National Register listing, we believe that it is prudent of the CTA to separately identify all CHRS orange-rated properties within the APEs on the historic resources spreadsheet. The effect of the Red Line Extension Project on these "orange" properties can then be determined and, if necessary, mitigated through direct discussions with DHED as early in the project as possible.

Observations concerning individual properties located in the APEs

1. Several buildings identified as "orange-rated" in the Chicago Historic Resources Survey (CHRS) were sampled by the CTA's historic resources consultants.

The **Classical Revival substation** at 10227 S. Halsted St. (Map 7) was determined eligible for National Register listing. It is a CHRS “orange-rated” building and was noted as such on the spreadsheet.

The **Fire Department Engine Co. 93 building** at 324 W. 104th St. (alternate: 328-330 W. 104th St.) (Map 30) was preliminarily determined eligible for National Register listing. It is a CHRS “orange-rated” building, but was not noted as such on the spreadsheet. It should be so noted.

The **Roseland Pumping Station** at 351 W. 104th St. (Map 30) was preliminarily determined eligible for National Register listing. It is a CHRS “orange-rated” building, but was not noted as such on the spreadsheet. It should be so noted.

The **French Eclectic style house** at 11310 S. Emerald Ave. (Map 12) was listed as a “local landmark” and preliminarily determined eligible of NR listing. However, it is not a designated Chicago Landmark. Instead, it is an “orange-rated” building in the CHRS, but was not noted as such on the spreadsheet It should be so noted.

The **Romanesque Revival style Church** at 10920 S. Princeton St. (Map 34) was preliminarily determined eligible for National Register listing. It is a CHRS “orange-rated” building, but was not noted as such on the spreadsheet. It should be so noted.

2. In addition, one building identified as “orange-rated” on the CHRS and located within the APE for the BRT option was not identified and sampled. The **two-story commercial building** at 11206 S. Michigan Ave. (listed as 11208 S. Michigan on Map 45) was not sampled by the historic resource survey. It is an “orange-rated” building in the CHRS (CHRS data form and Google Earth photo attached) and should be noted as such on the spreadsheet. It should also be separately evaluated for National Register eligibility.

I would be pleased to assist the CTA’s consultant team as they gather additional information on historic resources within the APEs for this project.

Sincerely,

Terry

RE: Red Line Extension– NR eligible properties in APE

Dear Ms. Tandon,

As requested, we have reviewed the APE boundaries and the properties identified within the APE that are listed in or "eligible" for listing in the National Register of Historic Places by the Red Line Extension project team.

We are very pleased to see the numerous properties identified and acknowledged as historic. However we have the following observations:

- We recommend including all properties that are orange-rated in the Chicago Historic Resources Survey (CHRS) in a separate category due to the fact that they will require an additional mitigation process through the city's demolition delay ordinance.
- During the driving tour of the preferred Red Line Extension routes, I took note of the following properties that were not included in the project team's list of eligible properties that looked as if they could be of possible architectural significance.
    - The American Ideal Cleaning Building at 10343 S. Michigan – a mid-century commercial building
    - The Lilydale Progressive M.B. Church at 10716 S. Michigan
    - City Sports store commercial block at 11102 S. Michigan
    - 11445-47 S. Michigan – Commercial/residential side by side Greystone – rated orange in CHRS
    - 11451 S. Michigan – one story commercial Art Deco building – rated orange in CHRS
    - Sure-Way Missionary Baptist Church at S.W. corner of Halsted and 120th. Art Deco corner building with a mid-century addition on the south side
    - Entrance gates and structure to Cedar Park Cemetery, 12584 S. Halsted
- Based on precedent with the Brown Line renovation project, we object to historic properties being purchased and demolished to make way for construction staging. We hope the team will specifically identify historic properties in the areas where construction staging may be planned to help identify alternative locations.

Thank you for the opportunity to review the findings by your team for this project. Please let me know if we can be of further assistance before the next consultation.

Sincerely,

Lisa DiChiera

RE: Red Line Extension – National Register eligible properties in APE

Dear Ms. Tandon,

As a housing and community development organization with longstanding ties to the greater Roseland area, we appreciate CTA inviting Neighborhood Housing Services of Chicago, Inc. (NHS) to participate in the Section 106 review for the proposed Red Line Extension routes. NHS believes the Red Line Extension project will ultimately enhance the livability and well-being of Roseland and surrounding neighborhoods by increasing transit access for residents. At the same time, we wish to ensure that the project minimizes any undue impacts on the existing residential, community, and historic buildings that make these neighborhoods great and that our experience has shown can be important community-building and engagement assets. Therefore, NHS would like to submit the following comments regarding the National Register eligible properties surveyed by the Red Line Extension project team in the APE:

- We recommend re-evaluating the exclusion of raised ranches – colloquially referred to "ranchelows" for looking like a cross between a Chicago bungalow and a ranch-style home – from the survey. While currently not a formally recognized form of Chicago vernacular architecture, these homes define the look and character of large stretches of the APE adjacent to UPRR right-of-way. We would encourage the CTA project team to determine if groupings of "ranchelows" in the APE could contribute to a future National Register district.
- During the van tour of the preferred Red Line Extension routes on January 30th, we also took note of the following areas that warrant additional surveying/review by the project team:
    - 111th & 112th South Eggleston: A few cast stone-faced residences were observed on or adjacent to these blocks, including one home immediately adjacent to the UPRR right-of-way. These buildings, which look similar to Chicago greystones, are relatively rare and should be evaluated for National Register eligibility.
    - 103rd Street to 104th Place between the UPRR and Princeton Avenue: This area includes the previously identified, National Register-eligible Roseland Pumping Station and Roseland Fire Station properties. However, the blocks also include a largely intact and well-maintained grouping of Chicago bungalows and frame

NeighborWorks®
CHARTERED MEMBER

EQUAL HOUSING OPPORTUNITY

cottages. We would encourage the project team to conduct a more detailed survey of these blocks to determine if these residential properties could contribute to a future National Register district.

- Though not directly applicable to the survey of National Register-eligible properties, we encourage the project team to carefully evaluate the potential impact of the Red Line Extension on the Fernwood Parkway that runs immediately west of the existing UPRR right-of-way. Albeit simply landscaped, the parkway provides a nice amenity to homes along Eggleston Avneue between 99th and 104th Streets.

In addition to these observations, we fully concur with the recommendations from Lisa DiChiera, Director of Advocacy, at Landmarks Illinois regarding specifically calling out "orange-rated" properties listed on the Chicago Historic Resources Survey; the additional commercial, religious, and community buildings that should be evaluated on Michigan Avenue and Halsted Street; and avoiding the demolition of any historic properties to make way for construction staging.

Thank you again for inviting NHS to participate in the Section 106 review for the Red Line Extension project. Please let us know if we can be of further assistance before the next scheduled consultation.

Best,

Matt Cole

Re: Red Line Extension – Possible negative effects to historic properties with in the proposed APE

Dear Ms. Tandon,

Thank you for facilitating the recent driving tour of the three proposed routes for the Red Line extension. I am writing in response to concerns our organization has regarding possible destruction of historic buildings or landscapes with the APE.

I have had a chance to review the comments being submitted by Landmarks Illinois and we agree with and support all of their concerns.

In addition, we are concerned about the negative consequences that building an elevated rail line down the middle of South Halsted Street would have on the tranquil and bucolic atmosphere of Cedar Park Cemetery.

Thank you for your consideration. We look forward to continuing our partnership on this exciting project.

Sincerely,

Jonathan Fine

Sonali Tandon
Chicago Transit Authority
567 West Lake Street, 10th Floor
Chicago, IL 60661

Dear Sonali,

Thanks for the opportunity to be a consulting party to the CTA's Red Line Extension (RLE) Section 106 eligibility process.

The Ridge Historical Society (RHS) serves the Beverly, Morgan Park and Washington Heights community areas on Chicago's south side. For this reason, we are particularly interested in the RLE impact upon historic properties in the APE situated within the Morgan Park and Washington Heights community areas. Both the Halsted Street and Union Pacific Railroad APE are located at the easternmost boundary of our service area. Please note that we do maintain an archival collection that reaches beyond our service area since our history does overlap with nearby areas, including West Pullman and Roseland. We reserve the right to comment on historic resources in other community areas just outside of our service area.

I have reviewed the materials and inventory forms submitted by the consulting team and offer the following comments.

IDENTIFIED NR ELIGIBLE PROPERTIES

The Ridge Historical Society agrees with the National Register (NR) eligibility of the two properties identified by the study in the Washington Heights community areas (our service area) – 10227 S. Halsted Street and 444 West 100th Place. Unfortunately, the team did not identify any NR eligible properties in the Morgan Park community area.

1. We agree that the City of Chicago Department of Gas and Electricity, Southwest Substation, at **10227 South Halsted Street** is NR eligible under C for its architecture, as a rare remaining example of a city government public works building. As stated on the study's inventory form, it is an orange rated building in the Chicago Historic Resource Survey (CHRS). The CHRS did supply a date of construction, 1919-20, that does not appear on the inventory form. I am wondering if this public works building is also NR eligible under A.
2. We agree that the single family dwelling at **444 West 100th Place**, built 1931, is potentially NR eligible under C for its architecture, as a rare brick Bungalow in

Washington Heights with striking Tudor Revival and Mediterranean Revival detailing. The Bungalow sports a handsome crenellated entry, decorative arches, and colonettes. I would not call this building Neo-Traditional, which is an architectural style reserved for late 20th-century buildings. I am concerned that this home once had a clay tile roof, perhaps jeopardizing its integrity. A similar house, designed by architect John Hoche, can be found in Beverly at 1762 W. 94th Street.

Additionally, I am providing architectural and historic info on other properties in the APE flagged as NR eligible by the team:

- The architectural firm of Fox and Fox designed S. S. Peter and Paul Church, **12433-12439 S. Halsted Street**, 1958-59. Architect John J. Fox, Jr. was a longtime resident of Beverly-Morgan Park and a noted local Roman Catholic church designer. He died in 2003.
- Venetian Hall, **133-139 E. Kensington Avenue**, was built in 1925-26 and designed by architect Arthur F. Hughes. Hughes is a local architect who designed a number of striking historic revival style homes in Beverly-Morgan Park.
- **11310 South Emerald Avenue** was built in 1927-28 for owner Stuart Colman. Note: the Individually Eligible category on page 2 of the inventory form says No when it should say Yes.

ADDITIONAL INDIVIDUAL PROPERTIES THAT MAY BE POTENTIALLY ELIGIBLE FOR THE NATIONAL REGISTER OF HISTORIC PLACES

The Ridge Historical Society would like the team to consider the following buildings for NR eligibility:

Roseland Auto Sales and Service Building (Allinone Auto Sales Building)
11200 South Halsted Street (Morgan Park)
Built 1927 for Henry T. Vollmer
Doerr, Lindquist and Doerr, architects

Potentially eligible under Criterion C for architecture as a rare remaining example of a garage and auto sales building from the early 20th-century in Morgan Park. Both Beverly-Morgan Park and Roseland were once major centers of auto sales on Chicago's south side, with dealerships along major area thoroughfares. Building is best known historically as a satellite salesroom for Roseland Auto Sales, featuring Studebakers. Additionally, Midland Terra Cotta Company provided the handsome terra cotta ornament for the one-story brick store building. Its integrity was likely questioned by its wood paneled storefront, but the original storefront may be behind the vertical boards If not individually eligible, perhaps eligible as part of a multiple property listing (see below).

Bethany Reformed Church Manse
3 West 111th Place
Craftsman-style single family residence
Built 1923-24
Purchased by church and addition built in 1928

Potentially eligible under criterion B for its historic associations with Reverend Harry J. Hager, pastor of Bethany Reformed Church from 1929-1975. Hager was a pioneer in media evangelism in Chicago during the mid 20th-century through his Sunday radio ministry broadcasts on local stations WHIP and WCFL. This church-related residence in the Craftsman style retains a high degree of architectural integrity, including a Gothic Revival style entry porch that likely dates to Hager's residency.

K. A. Pridjian and Company Building
11600 South Halsted Street
Built 1960

Potentially eligible under Criterion A for its historic associations with longtime local business, K. A. Pridjian and Company, Rug Cleaning and Sales. Established in 1924 in Roseland, Pridjian first operated at 54 West 111th Street. Owner K. A. Pridjian (d. May 6, 1965) had the facility built specially for his rug operation. Building retains much of its integrity in its mid-century storefront design, materials, and signage. (side note: Almost everyone in Beverly-Morgan Park has their rugs cleaned by Pridjian!)

Roseland Community Hospital Nurses Home
11321 South Wentworth Avenue
Built 1923-24
E. Hall, architect.

Potentially eligible under Criterion C for its architecture as a rare remaining example of a unique education-related building type in Chicago, a hospital-affiliated nurses' home. The three-story brick, Roseland Community Hospital Nurses' Home provided housing and educational opportunities for women training in the nursing profession. The interior may still reflect dormitory rooms, classrooms, and other spaces essential for nurses' training during the early 20th-century. Not sure how many of these building types are left in Chicago, but might be one of the only on the south side.

Galloy and Van Etten Cut Stone Contractors Building
11756 South Halsted Street
Built over time – 1921, 1928, 1946 and 1950

Potentially eligible under Criteria C for its associations with the Van Etten family, prominent local builders on Chicago's south side. Galloy and Van Etten, a longtime cut stone contracting business near the Panhandle railroad tracks, has operated continuously at this site from at least 1909. The cut stone exterior of the buildings within the complex reflects its occupant's trade. Founder Abe Van Etten was the brother of Simon and Henry Van Etten, whose contracting firm known as Van Etten Brothers built monumental residences and religious buildings on the south side. Galloy and Van Etten likely provided the cut stone used in many of these buildings.

NR ELIGIBLE CONTIGUOUS HISTORIC DISTRICTS OR MULTIPLE PROPERTIES

The Ridge Historical Society urges the team to revisit any groupings of historic properties that may be potentially NR eligible as contiguous districts or as multiple property listings The APE is located in a section on Chicago's south side that has been under surveyed in the past, and as a result, little data is available and very few historic resources have been proactively designated as local landmarks or listed in the National Register of Historic Places. Perhaps our community areas need a different approach in this type of study, especially when conducting cultural resource surveys. For example, surveyors could relax harsh integrity standards or look at broader patterns that might lead to multiple property nominations.

Here are some suggestions:

1. Would any of the Historic Residential Railroad Suburbs or Historic Streetcar Communities in the APE be NR eligible as multiple property listings? Since suburban development was extensive outside of nineteenth-century Chicago, perhaps the team could take a second look at the communities that were stimulated and developed along the area's railroads and streetcars in 19th-century Calumet Township and Chicago's early 20th-century neighborhoods. Especially important are those along the Chicago and Eastern Illinois, which came through in 1880-81 (UPRR APE); the Chicago and Great Eastern Railroad, an early subsidiary of the Pittsburgh, Cleveland, Chicago and St. Louis Railway who constructed tracks in 1865 (Halsted APE); and the Illinois Central Railroad who operated an east-west spur at 121st Street. Streetcars were operating along Michigan Avenue, 103rd Street, 111th Street, 115th Street and 119th Street, and stimulating residential and commercial development.

   Properties Associated with the former suburban Village of Fernwood. Fernwood is now part of the Washington Heights community area and within the RHS service area.

   Fernwood, a station stop on the Chicago and Eastern Indiana Railroad was first incorporated as a village in 1886 and annexed to the City of Chicago in Spring of 1891. Focused on a station at the 103rd Street crossing (then Tracy Avenue), Fernwood was mostly a residential district, with a few locally serving commercial buildings. Its boundaries ran from 90th Street on the north, 103rd Street on the south, Stewart Avenue on the East, and Morgan and Halsted on the west. Developers E. L. Gillette and Henry L. Hill, along with S. Montgomery Smith, laid out Fernwood in 1883 for residential development with an adjacent public park, approximately 75 feet wide along the tracks from 99th Street to 103rd Street. This park, now known as Fernwood Parkway, played a significant role in the development of this railroad suburb. This landscape feature marks the importance of open space, trees, and grassy public space to a growing residential suburb. Within the APE, a number of frame homes on suburban size lots remain, particularly along Eggleston Avenue, representing this period of development. Yet, these residences may have integrity issues (see 10100 South Eggleston Avenue), and many of Fernwood's signature buildings are either outside of the APE (including churches and a public school) or have been demolished (such as the Fernwood Station and Gillette Hall).

2. **Historic automobile-related buildings along major thoroughfares, including service stations, garages and car sales dealerships**. In reviewing the inventory forms in the APE, the team recorded a large number of auto-related buildings, although not contiguous. Halsted Street and Michigan Avenue were both major thoroughfares for the area, and as stated above, both Beverly-Morgan Park and Roseland were once major centers of auto sales on Chicago's south side. Could these buildings be NR eligible as a multiple property nomination?

3. **Chicago Georgian and Raised Ranch Historic Districts**. Just like the Chicago Bungalow Multiple Property Listing and subsequent NR districts, perhaps a multiple property listing is imminent for neighborhoods of Chicago Georgians and Raised Ranches. Both are mid 20th-century vernacular types which evolved from the earlier designs and plans of the American Foursquare and Bungalow respectively. Rows of raised ranches (also known as Bungalow Ranches) are found in the Halsted APE.

GENERAL COMMENTS AND CORRECTIONS:

1. Usage of catch-all architectural styles and types. Most every building I reviewed was labeled vernacular. Architectural styles, when used, were inconsistent. Using catch all categories makes it quite difficult to sort, review and compare important architectural specimens. Upon request, I can provide corrections to architectural styles and types in the Washington Heights and Morgan Park community areas.
2. Historic and current functions and uses should match National Register categories.
3. Construction dates for historic buildings in the APE came from an unreliable source– Cook County Assessor lists. A better primary source, such as City of Chicago building permit records, should be used for those properties determined NR eligible. It is disappointing that the team did not conduct basic research on the very small number of buildings (9) determined eligible in the study under NR Criterion C for architecture. Construction dates, owners, architects and builders would surely add to the historic context and story.

4. 748 E. 103rd Street (Washington Heights) should be **748 W. 103rd Street**.
5. Noted Beverly-Morgan Park architect Murray Hetherington designed the Tudor Revival-style residence at **11001 South Green Street** (Morgan Park), built 1940-41. Although a handsome, small scale Tudor Revival house, strict integrity standards were applied by the team.

Please contact me with further questions.

Sincerely,

Jennifer R. Kenny

PREPARED BY: Rebecca Thompson

ISSUE DATE: June 6, 2014

Meeting called to order at 10:00 am CT

Objective: Red Line Extension Effects Meeting for Section 106 Consultation

Item No.	***Item Description***
1	**Welcome/Intro** Mike Connelly welcomed attendees. JM reviewed the agenda and informed attendees that a public Open House is scheduled for May 13.
2	**Review of Project and Previous Section 106 Tasks** ST explained the overall purpose of the project and alternatives. JM provided an overview of the four-step Section 106 process, which is intended to assess project effects on historic resources (those previously identified as eligible for National Register of Historic Places [NRHP] listing). JM identified ground rules and reviewed previous coordination efforts undertaken to date as part of the Project. In response to comments received after the eligibility consultation in January 2013, Kensington Park was surveyed but was not recommended as eligible. Six potential historic districts were suggested; Green Street is recommended as eligible. Nine individual resources were suggested for reconsiderations. Of these, four resources are recommended as eligible based on supplemental information.
3	**Overview of Alternatives** JM presented an overview of the four alternatives that will be evaluated in the EIS: No Action, Bus Rapid Transit (BRT) along Michigan Avenue, the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Rail Alternative. - Q: Is the BRT park-and-ride lot on the north side of 130th Street? A: Yes. - Q: Why are the garages shown as three levels? As shown, it looks like a huge impact on Altgeld Gardens. A: Preliminary ridership analysis indicates park-and-ride demand, which is why we are proposing such large structures. As we fine tune the design moving forward, we'll re-evaluate the garage sizes and incorporate some urban design elements to mitigate the impact. - Q: How many properties would be removed along the Halsted route? A: We'll discuss this at the individual community meetings and Open House. The focus of this meeting is effects on historic resources. - Q: Are the piers for the Halsted line in the sidewalk or street? A: That will be determined in future engineering phases. The straddle bent piers could encroach into the parking lane. - Q: Would the Halsted piers have a similar placement to the structure at the Morgan/Lake? A: Halsted Street has two travel lanes and a parking lane in each direction and is wider than the configuration at Lake Street. The pier type chosen will make a difference on placement too. There could be impacts on parking spaces. *Follow up note: All traffic impacts would be covered in the Transportation section of the Draft EIS.* - Q: How high is the structure along Halsted? A: It varies – roughly 23-30 feet above ground level; the necessary height is determined based on the street clearance requirements. - Comment: In talking with business owners at Galloy & Van Etten Stone Contractors, they are worried about their large trucks being able to access their sites.
4	**Section 106 Effects on National Register of Historic Places Eligible Resources** The team developed effects recommendations based on the conceptual alternatives described previously. JM stepped through each resource. The criteria for determining effects are defined in 36 CFR 800.5. For the three options of Union Pacific Railroad (UPRR) Alternative, the team examined the option that is closest to the historic resource, to represent the worst case analysis. - Q: Will you be sending a copy of the slides? A: The Effects Report provides general information and distances and CTA will have additional

Item No.	***Item Description***
	boards at the Open House, which will also be posted on CTA website. The effects slides contain preliminary deliberative materials so CTA will not be circulating copies. - Comment: The Cottage/Bungalow District that Neighborhood Housing Services of Chicago (NHS) commented on in the eligibility comments shows up in the map near the Pump Station. - WM: How close is the East Option UPRR track structure to the Pumping Station? A: It is close and almost adjacent– we'll have to look it up. *Follow-up note: Horizontally, it is about 8.8 feet between the pump station and track structure in the UPRR East Option. However this distance is based on conceptual engineering and can change slightly as additional detailed engineering is performed.* - Comment: If there is a future expansion along the UPRR line, we want to be sure that there is ample room to accommodate it. It would be good if the alternative were further from the building; I question whether it is actually a "No Effect" as shown. Response: It is a tight site at the Pumping Station. We are required to be outside of UPRR right-of-way. - Q: Does the analysis include staging areas as well? A: Yes. These are included in the footprints. - Q: How tall is the BRT garage by the Venetian Hall? A: 2 stories *Correction: it is 3 stories with some space for retail and community facilities at ground floor.* - Q: Are there any buildings in the footprint of the proposed garage? A: We looked at all the potential displacements associated with each alternative. There are no structures within the garage footprint that would be displaced. - Q: Is it a possibility to adopt/restore the Venetian Hall as part of the adjacent garage? Or incorporate similar elements in the garage design? A: If there is an adverse effect, we will try to mitigate that. We will look at improving the view of the garage and making it more street friendly. CTA can take this under consideration. - Q: NHS' eligibility comments included the cast masonry structures, one of which appears immediately south of the Venetian Hall. What was the determination there? A: Those were determined non-eligible; several were surveyed and lacked integrity and/or distinguishing architectural features. There wasn't a cohesive grouping either. - Q: What is the building across from the garage, next to Altgeld Gardens? A: There is a park; the buildings next to the park may be part of Golden Gate. - Q: What is the station like for UPRR at the west option? A: Trains stop, unload/load, and turn back. There is no yard or additional tracks at this location – the yard is proposed further north at 120th Street. - Comment: The garage could have a visual impact. Nothing else nearby is built at that scale/height. There may be an impact on the Altgeld Garden Historic District, which will likely gain historic significance into the future due to its association with President Obama. CTA should consider a more modest garage design. - Comment: Several parties would like to see a view of the West Terminal station option from directly across 130th Street at Altgeld. Response: Early communications with community members indicated a local preference for the South Station option, which would have an entrance south of 130th Street. - Comment: Both 130th UPRR station options need further study – there will be impacts to transportation, people's homes, etc. *Follow-up note: All other impacts will be discussed in the Draft EIS.* - Q: How difficult is it to cross from the south station to Altgeld or Philip Homes? A: 130th Street is on a viaduct that allows the tracks and platforms to extend under 130th Street. You wouldn't have to cross 130th Street to get to the Station, only a local street. - Q: Are the viaducts safe for travel?

Item No.	***Item Description***
	A: Vehicles travel on the 130th Street viaduct today. - Q: Will a station include CTA/CDOT landscaping improvements to link to Altgeld? A: Definitely. A study was conducted focusing on access and connectivity at 130th Street Station. CTA has coordinated and will continue to coordinate with CHA to integrate plans. - Comment: At the Green Street Historic District, track structure will certainly be visible and audible. - Q: What level of noise impacts are anticipated along Green Street? A: Noise mitigation measures (e.g. noise walls, closed deck, etc.) have been incorporated into preliminary designs to mitigate impacts. *Follow-up: Based on the general level noise analysis conducted per FTA guidance, the Green Street Historic District lies at the edge of the moderate noise impact zone, assuming the project includes 3-4 foot high noise barriers and a closed deck structure. Historic experts will reexamine potential effects on the Green Street Historic District.* - Comment: I think property owners who live within the Green Street Historic District would be adversely affected by the Halsted Alternative. Response: That will definitely be looked at as part of the National Environment Policy Act (NEPA) analysis. - Comment: As you look at this more, it would be nice to have a rendering showing how close the tracks are and what the relationship will look like between the Halsted line and Green Street district. - Comment: The former substation is city-owned and vacant. Consider incorporating it into the station. Maybe it could be an entry point. This provides a good opportunity to give back to the community by adopting some of the Chicago Historic Resources Survey Orange buildings, similar to measures at the Wilson station. - Comment: The French Eclectic House would experience the same impacts as Green Street. There are several nice homes within this block, possibly nicer than the resources along Green Street, though they lack the consistency of Green Street. Scale and noise will be issues. These areas could be negatively impacted, driving people to move out of the area. - Comment: Galloy and van Etten is a family business and has been in the area since 1899. Photos show the building dating to 1909; it is a huge resource for the area. The business owner feels like they would be so adversely affected by the Halsted Alternative that they would have to relocate. It is a fourth generation family-owned business and provides a lot of employment. They are also concerned about the proximity to the 119th Street yard. - Comment: A lot of businesses are within the 119th Street yard. It used to feed all of Roseland with jobs. Many of the buildings have been demolished but some are left and could be negatively impacted. Response: CTA is coordinating with Far South Community Development Corporation regarding potential impacts on businesses. - Comment: Several consulting parties requested renderings for the four adversely affected resources along Halsted. - Q: What about impacts on the rest of the cemetery? A: Only the gatehouse/entryway is considered eligible. Comment: The impacts on the cemetery will be assessed as part of NEPA analysis. - Q: Is the fire station within the rail yard still accessible? A: Yes. - Comment: By placing the tracks so close to the resource, are you precluding future viability of the resource to function? This is an issue at the fire station and the St. Peter & Paul Church in particular. TT: The fire station’s current location isn’t particularly viable as it is today. Perhaps relocating this building should be a consideration as part of mitigation, although we don’t typically like to

Item No.	***Item Description***
	move structures. The fire station would be more viable on an arterial. The trend city-wide has been to close a number of these smaller structures. - Comment: We've heard some good ideas regarding mitigation, but there are a few steps between now and then. We still have to have a selected alternative before developing detailed mitigation measures.
5	**Schedule and Next Steps** There is an open house next week. A Draft EIS is being prepared, which will include additional analyses and public involvement opportunities. - Q: When would a single preferred alternative be selected? A: The Final EIS would be prepared on a single alternative. - Q: Is there a way to understand whether any of the resources we identified in the eligibility phase that were not determined eligible would be affected? A: They were not examined as part of this analysis since we evaluated only eligible buildings or districts for Effects determination. - Comment: Please resend the responses to eligibility comments.

Please notify ST of any corrections and/or clarifications to the minutes within five (5) business days.

cc: Attendees

Red Line Extension (RLE) Summary of Effects Comments received from the Consulting Parties and Responses from the Project Team

The following paragraphs briefly summarize comments received from the consulting parties regarding the project effects on historic resources for the RLE Project and corresponding responses from the project team. Under the Section 106 consultation process, the Chicago Transit Authority (CTA) undertook an extensive data collection and analysis effort during fall 2012 to identify historic resources located within the Area of Potential Effect (APE) for the three build alternatives that are under evaluation in the RLE Draft Environmental Impact Statement (EIS). This analysis culminated in recommendations regarding the potential eligibility of historic resources pursuant to the National Historic Preservation Act of 1966. These recommendations were presented to the ten consulting parties, including the Illinois Historic Preservation Agency (IHPA), during a meeting on January 30, 2013. Input from consulting parties was considered throughout 2013, resulting in 13 individual properties and two historic districts being identified as eligible under the National Register of Historic Places (NRHP) criteria.

Following this step in the consultation process, CTA undertook an analysis of effects on NRHP-eligible historic properties in accordance with criteria established in 36 CFR 800.5. This analysis culminated in recommendations regarding the potential effects on historic resources, which were mailed to consulting parties on April 18, 2014, requesting any written comments by May 23, 2014. An in-person meeting was conducted on May 8, 2014 to discuss these recommendations. Participants were asked to provide relevant information from their perspective that may supplement the effects recommendations summarized in the April 18 packet. Written comments were received from the following four organizations:

- Anne Haaker, Illinois Historic Preservation Agency (IHPA)
- Lisa DiChiera, Landmarks Illinois
- Matt Cole, Neighborhood Housing Services of Chicago
- Terry Tatum, City of Chicago, Department of Planning and Development, Historic Preservation Division

Comments and responses are presented by general topic below. Based on local knowledge and input from the consulting parties, additional analysis was undertaken regarding historic resources within the APE. The original recommendations presented in April/May 2014 will be revised as described below and presented in the RLE Draft EIS.

The CTA announced on August 10, 2014 that as part of its planning process to extend rail service to 130th Street on the far South Side, it has narrowed down the alternatives to two preliminary options for the proposed RLE Project. Based on feedback received from the public this spring and summer via community meetings and comments provided to the agency, the CTA is now focusing on one “preferred alternative” with two possible variations from the three build alternatives that have been under consideration. The CTA believes these options would best serve communities and residents on the Far South Side:

- Union Pacific Railroad Rail (UPRR) Alternative, East Option. Under this option, CTA tracks would be placed immediately east of the Union Pacific railroad right-of-way from 99th Street to 118th Street

- UPRR Alternative, West Option. Under this option, CTA tracks would be placed immediately west of Union Pacific's right-of-way from 99th Street to north of 118th Street.

The proposed alignment of the rapid transit line would be the same for the two East and West options north of 99th Street and south of 118th Street.

Eligibility Reconsideration Requests

1. Resurvey the grouping of Chicago bungalows and frame cottages at 103rd Street to 104th Place between the UPRR line and Princeton Avenue.
   Nine resources (Chicago bungalows and frame cottages) were surveyed as part of the representative sample of surveys. Although the area contains numerous residences with similar architectural styles, massing, setbacks, and construction dates, architectural historians verified that these properties do not retain sufficient integrity for the NRHP as a district due to contemporary alterations (e.g., replacement siding, porches, windows, and doors). None were found to merit individual listing for the NRHP due to their integrity. Numerous vacant lots disrupt the visual cohesiveness of this area. Despite the general consistency in property types, the collection of bungalows and frame cottages is broadly representative of residential areas on the South Side, lacking the distinguishing elements to qualify as NRHP eligible. Please refer to forms 301, 306, 321, or 326 W 103rd Place; 262, 328, or 335 W 104th Place; or 310 or 325 W 104th Street on the Eligibility DVD provided to consulting parties on January 4, 2013 for specific examples.

2. Reconsider eligibility determinations for cast stone-faced residences adjacent to the UPRR right-of-way, including the property adjacent to the Venetian Hall.
   The properties adjacent to the Venetian Hall are a brick two-flat (129 E Kensington Ave on southwest side) and a vinyl-clad multi-residence (141 E Kensington Ave on the east side). Neither building exhibits distinctive architectural features or sufficient integrity for inclusion on the NRHP. Likewise, the two cast stone-faced houses facing the Venetian Hall (122 and 136 E Kensington Ave) do not feature distinctive architectural elements or sufficient integrity for inclusion on the NRHP. Architectural historians verified that these properties do not retain sufficient integrity for the NRHP due to contemporary alterations (e.g., replacement porch, windows, and doors), compromising the historic materials and workmanship. No cohesive set of similar properties has been identified in the vicinity that would merit consideration as a potential historic district or multiple property grouping.

3. Reassess the area around 111th Street at Emerald Avenue for a potential district.
   CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The area around 111th Street at Emerald Avenue is distant from the UPRR Alterative corridor and would not be affected by the RLE Project.

Effects Reconsideration Requests

4. Reevaluate the visual, noise, and economic effects of the Halsted Alternative on the Green Street Historic District, which could have a significant impact on the quality of life without proper mitigation.
   CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The Green Street Historic District is distant from the UPRR Alterative

corridor and would not be affected by the RLE Project.

5. Reassess No Effect finding for the Altgeld Gardens Historic District based on the UPRR Alternative. The proposed station and garage would alter the landscape; a rendering should be developed.
   Altgeld Gardens Historic District is eligible for NRHP listing under Criterion A (i.e., events that have made a significant contribution to the broad patterns of American history on a local, state, and/or national level) based on its association with community development, planning, and social history. As defined by 36 CFR 800.5, an adverse effect on this resource would be an "alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the NRHP." While the UPRR Rail Alternative would increase transportation choices and improve access for this geographically isolated area, none of the proposed infrastructure improvements in the vicinity would significantly alter the characteristics that qualify the district as eligible for NRHP listing. As part of the UPRR Rail Alternative, an at-grade station and parking facilities would be constructed in one of two locations to provide access to the Altgeld Gardens Housing Project: a South Station Option or a West Station Option. Either station location option is separated from Altgeld Gardens Historic District by a multi-lane street (i.e., E. 130th Street and/or E. 130th Place). Preliminary plans for each terminal station option would include parking for 2,300 vehicles through a combination of a parking structure and surface parking lots.

   The South Station Option parking structure for the UPRR 130th Street Station is approximately 800 feet from Altgeld Gardens Historic District at its closest point; the parking structure would not be visible from within the historic district and would not adversely affect the historic district.

   The West Station Option parking structure for the UPRR 130th Street Station is approximately 400 feet from Altgeld Gardens Historic District at its closest point and would only be visible from the outer line of buildings on the north side of the Altgeld Gardens development. This outer row of buildings would obstruct the view of the parking structure from interior buildings and streets. The construction of the West Station Option would not adversely affect the characteristics that qualify the district as eligible for NRHP listing, i.e. its association with community development, planning, and social history.

   As the project would not adversely affect the integrity of the district or its association with community development, planning, and social history, any visual simulation rendering and any appropriate mitigation measures identified would occur independent of the formal Section 106 consultation process for this resource.

   The UPRR Alternative has been selected as the National Environmental Policy Act (NEPA) Preferred Alternative, and an additional rendering of the station will be developed and presented as part of the Draft EIS to assist local stakeholders in understanding the extent of visual impacts created by the project.

6. Reassess No Effect finding for the Roseland Pumping Station based on the UPRR Alternative.
   For the UPRR East Option, the track structure is approximately 8.8 feet from the side of the building at its nearest point. It should be noted that an existing at-grade freight line runs in close proximity to this location. The pumping station would not be displaced or directly affected by the UPRR Rail Alternative. The changes in the setting (e.g., visual, noise, vibration, etc.) would

not adversely affect the characteristics that qualify the resource as eligible for NRHP listing, i.e. its architecture.

The UPRR West Option would also not affect the characteristics that qualify the resource as eligible for NRHP listing.

7. CTA should develop appropriate renderings for all properties in the APE where there was a finding of No Adverse Effect or Adverse Effect.
   CTA will develop additional visual simulation renderings, for inclusion in the Draft EIS, of the UPRR Alternative, which has been selected as the NEPA Preferred Alternative. Renderings are particularly helpful in understanding the extent of visual impacts and in developing appropriate mitigation measures for any adversely affected historic resources.

   At the current stage of Effects consultation, additional renderings would not change the effects findings for NRHP-eligible resources. Justification for effects findings was provided in the effects report mailed to consulting parties and additional justification is included in this document. As a reminder, the key consideration is whether the project would alter the specific characteristics that qualify a resource as eligible for the NRHP.

   In addition to the Historic impacts, the Draft EIS will also include a discussion of the potential visual impacts of the RLE Project alternatives, including general renderings of the alternatives that were prepared to assess those impacts. Some of those renderings were also presented at the May 13th CTA open house and the exhibit boards can be viewed at http://www.transitchicago.com/assets/1/red_ahead/MS_CWC_CL_RLE_Exhibit_Boards_lowres_FINAL_20140515.pdf

8. Renderings should be developed for any NRHP or Chicago Historic Resources Survey (CHRS) Orange properties potentially impacted by the close proximity of the proposed elevated track structures.
   See Response #7.

9. The property owner of the Galloy and Van Etten Stone Contractors business is concerned about their access and viability if the Halsted Alternative is built.
   CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The Galloy and Van Etten Stone Contractors business is distant from the UPRR Alternative corridor and would not be impacted.

10. Noise studies should be undertaken to demonstrate that the introduction of the elevated rail structure on Halsted would not adversely affect historic resources within the APE of that route.
    CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. Noise analysis has been conducted per Federal Transit Administration (FTA) guidance and mitigation measures have been identified, which will be presented in the Draft EIS.

11. The French Eclectic House would experience the same impacts as Green Street. Scale and noise would be issues. These areas could be negatively impacted, driving people to move out of the area.

CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The French Eclectic House is distant from the UPRR Alterative corridor and would not be affected by the RLE Project.

Other Comments

12. In general, we [IHPA] concur with the findings concerning historic architectural resources presented in the draft report. The Bus Rapid Transit (BRT) Alternative would have the least impacts, followed by the UPRR Alternative.

13. The potential to encounter archaeological resources needs to be addressed. If the potential for undisturbed archaeological resources exists, a survey will be required.
    No previously recorded archaeological sites fall within the RLE APE and therefore the project would produce no effect on known archaeological resources. The need for and extent of further archaeological investigations will be determined in consultation with IHPA.

14. CTA should consider incorporating the city-owned, vacant historic substation (10227 S. Halsted Street) into plans for the nearby station.
    CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued; the vacant historic substation would not be affected by the RLE Project.

Chicago, IL 60661-1498

Dear Ms. Tandon:

Thank you for requesting comments from our office concerning the possible effects of the referenced project on cultural resources. Our comments are required by Section 106 of the National Historic Preservation Act of 1966, as amended, and its implementing regulations, 36 CFR 800: "Protection of Historic Properties".

We are in receipt of the 2014 *Draft Effects Report*, and appreciated the opportunity to participate in the May 8, 2014 meeting at the CTA where your findings were presented. In general we concur with the findings concerning historic architectural resources presented in the draft report. However, the report indicates that noise walls will reduce the amount of noise that resources such as the proposed Green Street Historic District will experience. Noise studies that include current conditions will need to be undertaken to demonstrate that the introduction of the elevated rail structure on Halstead will not adversely affect historic resources located within the APE of that route.

It was noted in the report that archaeological resources may be uncovered during construction activities and that they would be investigated once found. At a minimum, the potential to encounter archaeological resources needs to be addressed and the results need to be presented to this office for review. If the potential for undisturbed archaeological resources exists within the areas of potential effect, a survey will be required.

As previously stated, it is our opinion that the proposed BRT route will affect the least amount of cultural resources located within its APE. We also believe the UPRR route that is often adjacent to existing railroad tracks will affect fewer resources than the elevated line proposed on Halsted Street.

We look forward to reviewing the final historic resources report once the preferred alternative has been selected and all cultural resource surveys have been completed.

If you have questions please contact David J. Halpin, Cultural Resources Manager, at 217-785-4998.

Sincerely,

Anne E. Haaker

RE: Red Line Extension – Potential Effects Consultation Comments

Dear Ms. Tandon,

Thank you for the opportunity to review on May 8th the Red Line Extension team's findings and recommendations regarding historic properties in the APE. We are pleased to see some additions made to the list of National Register-eligible properties and the identification of orange-rated buildings in the Chicago Historic Resources Survey (CHRS) based on our February 18, 2013 letter.

From the May 8th meeting, we have the following comments:

- We strongly recommend that better renderings are produced to illustrate the potential impact of a UPRR West Station and four-story parking garage on 130th Street and the adjacent Altgeld Gardens Historic District.
- We agree with comments made during the meeting that the "No Effect" determination made for the Roseland Pumping Station, 351 W. 104th St., and Altgeld Gardens Housing Project Historic District, under the UPRR Rail scenario, should be reassessed as potentially having an "Adverse Effect" determination.
- We recommend producing renderings that will illustrate the "Adverse Effect" on National Register-eligible properties in the Halsted Rail scenario. This is particularly important if the proximity of rail tracks could potentially make these properties less viable in the future. These properties include:
    - The Former Classic Revival Substation, 10227 S. Halsted St.
    - The S.S. Peter & Paul Catholic Church at 12433-12439 S. Halsted St.
    - Cedar Park Cemetery Entryway and Gatehouse, 12540 S. Halsted St.
    - Fire Department Engine Company 115, 931 W. 120th St.
- While we understand that the design phase of a Halsted Rail scenario, if selected, will be some time later, we would like consideration to be made of incorporating the city-owned and vacant historic substation at 10227 S. Halsted St. into plans for a station that was indicated would be built in that vicinity.
- Lastly, we support the reassessments suggested by Matt Cole of Neighborhood Housing Services in his May 14, 2014 letter.

Again, thank you for the opportunity to review the findings by your team for this project.

Sincerely,

Lisa Di Chiera

RE: Red Line Extension – Potential Impacts to National Register Eligible Properties in APE

Dear Ms. Tandon,

Thank you again for inviting NHS to participate in the Section 106 review process for the Red Line Extension project. We believe that extending the Red Line will ultimately enhance the livability and well-being of the greater Roseland-area. At the same time, as an organization rooted in the use of asset-based community development strategies, we wish to ensure that the project minimizes any undue impacts on the existing residential, community, and historic buildings that make these neighborhoods great and that our experience has shown can be important community-building and engagement assets. Therefore, based on the information presented in the May 9th Effects Meeting, we recommend that the following additional actions be undertaken by the project team before any mitigation planning is undertaken:

- Develop appropriate and assessable renderings for all properties in the APE where there was a finding of No Adverse Effect or Adverse Effect. This currently includes the Former Venetian Hall, the Green Street Historic District, the Former Classical Revival Substation, Galloy and Van Etten Stone Contractors, S.S. Peter & Paul Catholic Church, Cedar Park Cemetary Entryway and Gatehouse, and Fire Department Engine Company 115. We also believe that such renderings should be created, as necessary, based on our recommendations below (e.g, re: Altgeld Garden Historic District).

- Re-Survey 103rd Street to 104th Place between the UPRR and Princeton Avenue: This area includes the previously identified, National Register-eligible Roseland Pumping Station and Roseland Fire Station properties. However, the blocks also include a largely intact and well-maintained grouping of Chicago bungalows and frame cottages. We would encourage the project team re-survey these blocks to determine if these residential properties could contribute to a future National Register district, as well as any potential impact that a UPRR-located elevated train line would have on such a district.

- Reassess Determination that Cast Stone-faced Residences in APE are not National Register Eligible: Several of these buildings, which look similar to Chicago Greystones and are relatively rare, were observed adjacent to the UPRR right-of-way. This includes the 2-flat on Kensington Avenue immediately east of the Former Venetian Hall.

- Reassess Finding of No Adverse Effect on Potential Green Street Historic District: Re-evaluate visual, noise, and economic effects of a Halsted-located elevated train line on homes along Green

Street. While such train lines do run through other residential areas of Chicago (e.g., Pink Line), this corridor would be new and could have a significant impact on the quality of life of the area without proper mitigation.

- Reassess Area Around 111th Street and Emerald Avenue for Potential Historic District: Re-survey area around 11310 South Emerald (Emerald, Union, and Wallace Avenues) for eligibility as a historic district. If determined eligible, assess effect of a Halsted-located elevated train line on the district.

- Reassess Finding of No Effect of a UPRR West Station on Altgeld Gardens Historic District: The proposed station, station house, and four-story parking garage would be located immediately to the north of Altgeld Gardens. The height of the parking garage would be taller than any other properties in the area and would likely loom above the landscaped tree line of 130th Street. The existing rendering of the proposed station developed by project team is inadequate to assess the effect of the station due to its oblique view from the west.

Thank you again for inviting NHS to participate in the Section 106 review for the Red Line Extension project. Please let us know if we can be of further assistance before the next scheduled consultation.

Best,

Matt Cole

Subject: Red Line Extension Historic Properties Consultation

Dear Ms. Tandon,

Thank you for hosting the consulting parties meeting held at CTA headquarters on May 8, 2014 for the Red Line Extension Historic Properties Consultation. We appreciate the opportunity to comment on the draft effects to historic properties that were discussed at that meeting.

Based on information provided, our comments are as follows:

1. Properties determined to be historic and/or color coded orange in the Chicago Historic Resources Survey and that would be potentially impacted by close proximity of elevated tracks under any of the alternative routes being considered should have photo renderings executed to show the effect of such close proximity of tracks. This would mainly include properties along the Halsted St. alternative, but would also include the UPRR east alternative route as it would affect the Roseland Pumping Station.

Our office looks forward to continuing to work with you on this exciting undertaking.

Sincerely,

Terry Tatum

Appendix E
2014–2015 Red Line Extension Project Update

2014-2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum

Historic and Cultural Resources

The refined alignment did not create any additional or different effects on historic resources.

Based on feedback from Section 106 consulting parties, CTA prepared two additional photo simulations. **Figure 1** shows a photo simulation of the elevated track structure adjacent to the Roseland Pumping Station under the East Option.

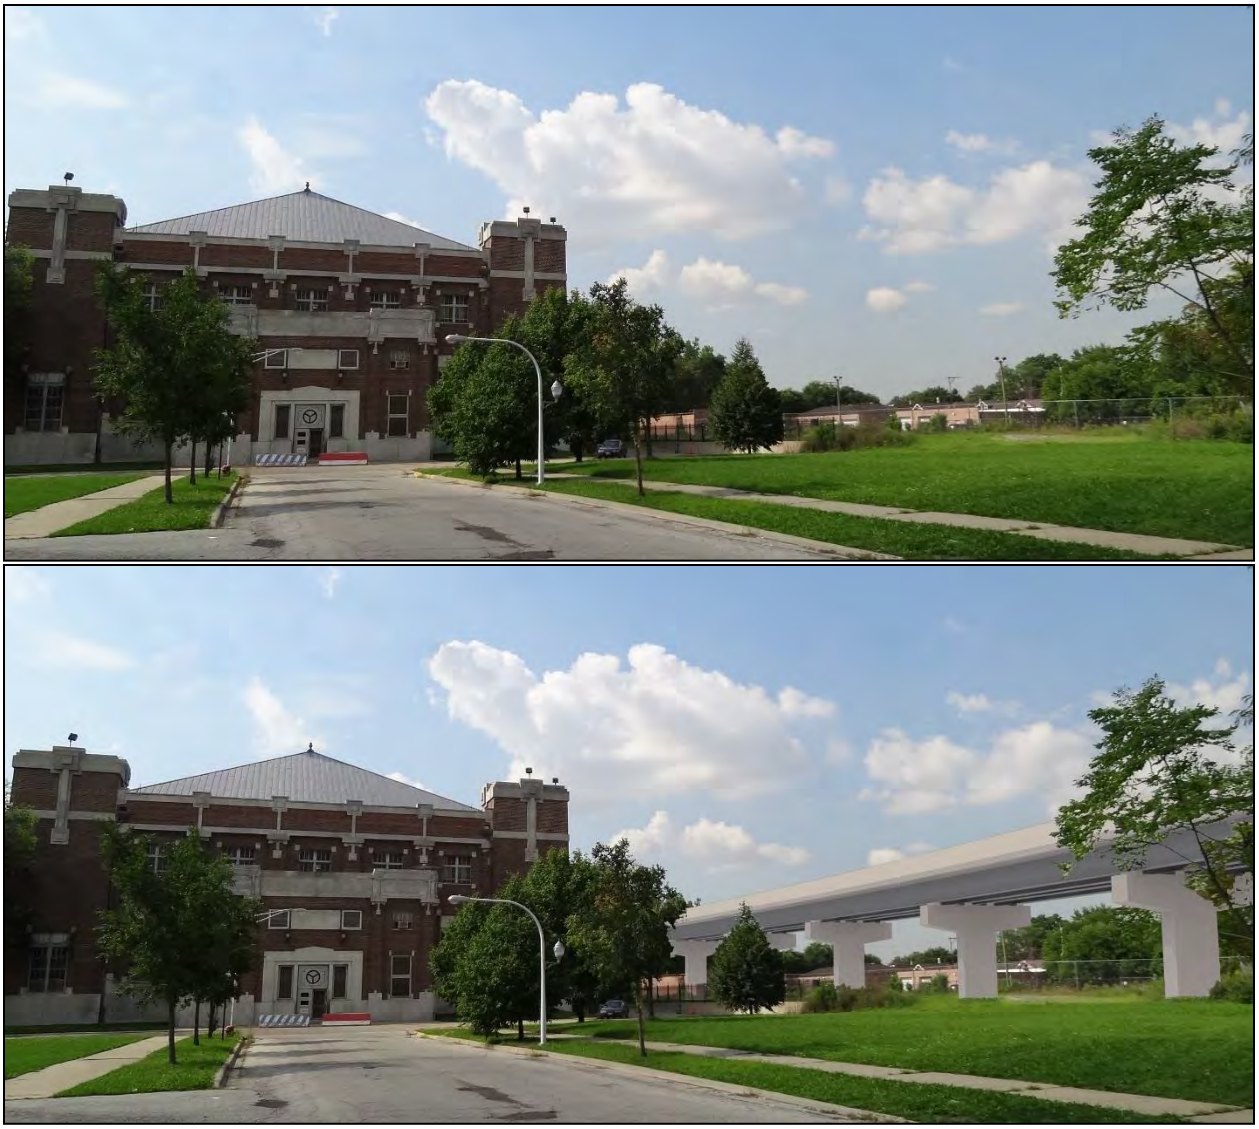

Figure 1: Photo of Existing Conditions and Photo Simulation of the Elevated Track Structure adjacent to the Roseland Pumping Station, Facing South on Harvard Avenue

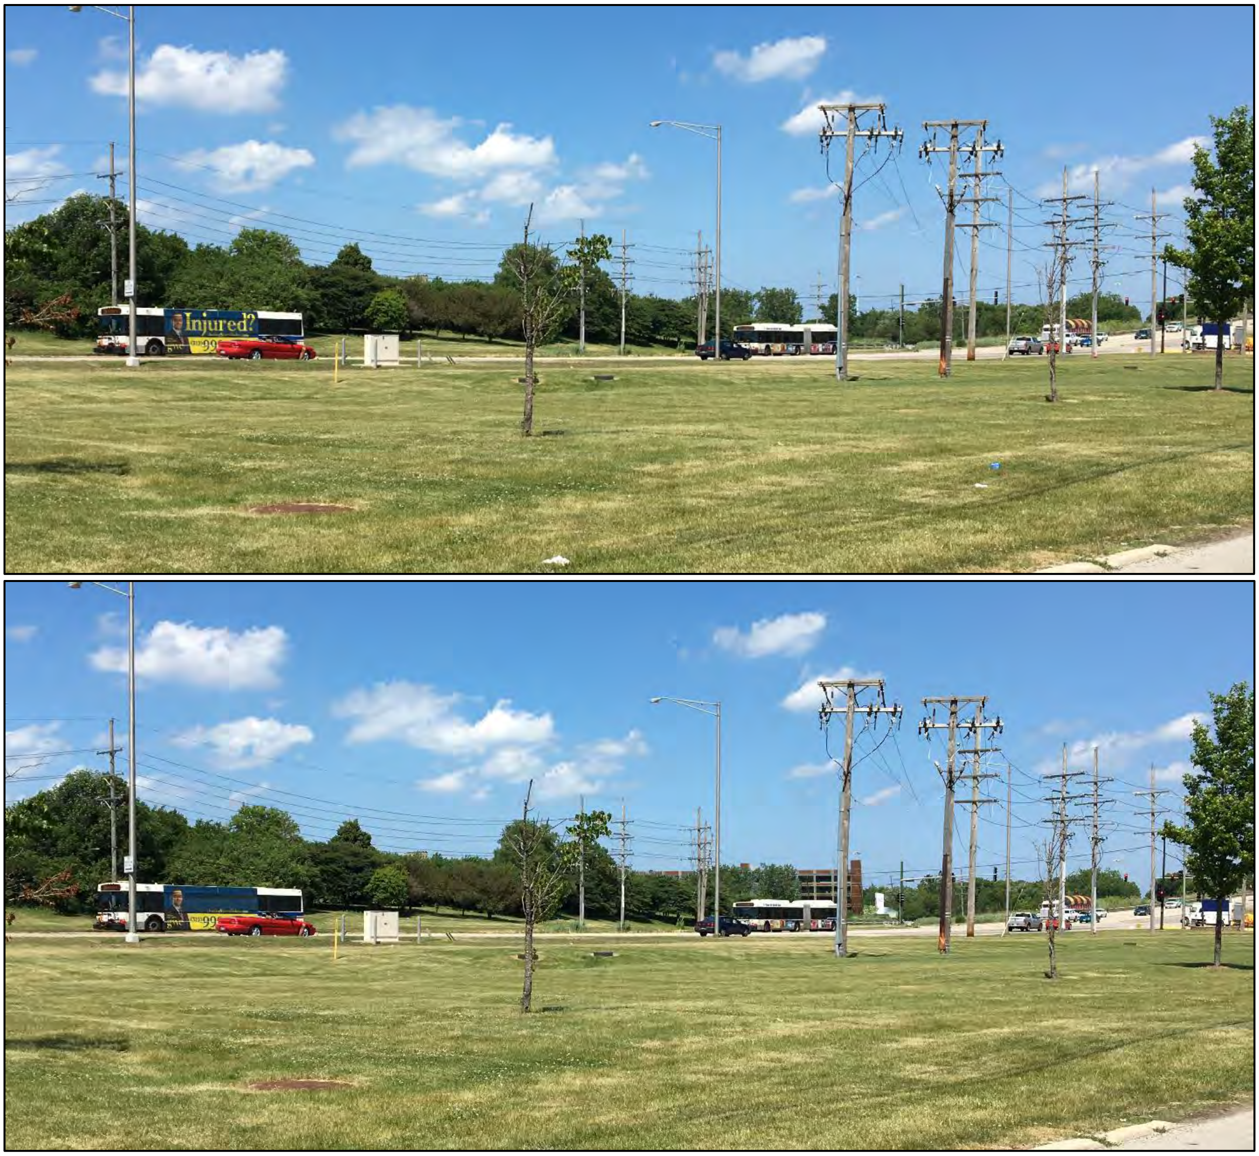
CTA also prepared a photo simulation of the 130th Street Station and parking garage as viewed from Altgeld Gardens, included as **Figure 2**.



In addition, Appendix D-3 of the *Historic and Cultural Resources Technical Memorandum* includes displacement maps. Please see Appendix I of the *Displacements and Relocation of Existing Uses Technical Memorandum* for displacement maps for the refined alignment.

Illinois Historic Preservation Agency
Attn: Dr. Rachel Leibowitz
Deputy State Historic Preservation Officer
1 Old State Capitol Plaza
Springfield, Illinois 62701-1507

**RE: CTA Red Line Extension Project, IHPA Log 001010713
FTA Section 106 Eligibility and Effects Determination**

Dear Dr. Leibowitz:

As part of its responsibilities under 36 C.F.R. § 800-Protection of Historic Properties, and the National Historic Preservation Act (NHPA), the Federal Transit Administration (FTA) is providing an update on the Section 106 consultation process for CTA's Red Line Extension (RLE) Project (Project) and requesting concurrence on determinations. The proposed Project will extend CTA's Red Line service an additional 5.3 miles from the Red Line's existing 95th Street Terminal to the vicinity of 130th Street. The extension would include three new intermediate stations with bus and parking facilities as well as a new terminal station. The Project is one part of CTA's Red Ahead Program to extend and enhance the entire Red Line.

FTA has previously determined that the Project will be a Federal undertaking as defined in § 800.16(y) and that it is a type of activity that has the potential to cause effects on historic properties. Over the past four years, FTA and CTA have conducted a Section 106 consultation process in coordination with the Illinois Historic Preservation Agency (IHPA) and other Consulting Parties. The following provides a chronology of these activities:

- 6/25/2012: FTA sent a letter to IHPA authorizing CTA to initiate the consultation process for the RLE Project.
- 7/20/2012: Conference call hosted by FTA and CTA with IHPA to introduce the Project, and discuss the Area of Potential Effects (APE), including a representative sampling methodology for surveying resources within the APE.
- 8/13/2012: FTA and CTA sent invitations to local organizations to become a Section 106 Consulting Party for the Project.
- 10/24/2012: FTA and CTA held a kickoff webinar with the Section 106 Consulting Parties. Items discussed included an overview of the Section 106 process, Consulting Parties' roles

in the process, general project information, the proposed Project APE, and Project alternatives.

- 1/30/2013: FTA and CTA held a Section 106 Eligibility Meeting with IHPA and Consulting Parties.
- 10/10/2013: FTA and CTA sent a Response to Comments to Consulting Parties and IHPA regarding findings on the eligibility of historic resources within the then current Project APE.
- 5/8/2014: FTA and CTA held a Section 106 Effects Meeting with IHPA and Consulting Parties to discuss the Draft Effects Report.
- 11/24/2014: FTA and CTA sent a Response to Comments to Consulting Parties and IHPA regarding findings on the effects on historic resources within the Project APE.

As part of the Project's National Environmental Policy Act (NEPA) Environmental Impact Statement (EIS) documentation, FTA and CTA have prepared the RLE Historic & Cultural Resources Eligibility and Effects Summary Report (the Summary Report) for the Project with appendices that include relevant materials from the Section 106 consultation process. A copy of the Summary Report is enclosed on a CD for your review.

In August 2014, based on the technical analysis, revised project Purpose and Need, and public input received to that point, CTA announced the NEPA Preferred Alternative—the UPRR Alternative, featuring an East and West Option. Eliminated from further review and analysis were the Bus Rapid Transit (BRT) Alternative, Union Pacific Railroad (UPRR) Alternative – Right-of-Way Option, and the Halsted Alternative, as well as the UPRR Alternative – West Station Option for the 130th Street station. As a result of these project changes, the APE has been revised to only incorporate the area around the UPRR Alternative (East and West Options). See Figure 2-4 in the Summary Report provided for the revised APE.

As described in the chronology above, on November 24, 2014, CTA provided responses to all comments received from the Consulting Parties in May of 2014. This comment response communication noted that the Project alternatives had been further narrowed, and that the UPRR Alternative (East and West Options) were proposed to move forward as the NEPA Preferred Alternative. Additional details on the Project alternatives development process and history, including the entirety of alternatives evaluated between 2012 and 2014 as part of the Section 106 consultation process for this project, are provided in Attachment 1 of the Summary Report.

Based on research conducted by CTA and documented in the Summary Report and its appendices, FTA has determined the following for the RLE Project:

280 resources over 50 years of age are located within the revised Project APE. Of these, 7 are eligible for the National Register of Historic Places (NRHP), including 6 individual buildings and 1 historic district. As summarized in the table below, of the 7 NRHP-eligible resources within the APE, 6 will experience **No Historic Properties Affected** and 1, the Roseland Pumping Station, will have **No Adverse Effect** as a result of the RLE Project.

ID	Description	Union Pacific Railroad Alternative East Option Effects Finding	Union Pacific Railroad Alternative West Option Effects Finding
1	Eclectic Neo-Traditional Home	No Historic Properties Affected	No Historic Properties Affected
2	Fire Department Engine Company 93	No Historic Properties Affected	No Historic Properties Affected
3	Roseland Pumping Station	No Adverse Effect	No Historic Properties Affected
4	Romanesque Revival-Style Church	No Historic Properties Affected	No Historic Properties Affected
5	Roseland Community Hospital Nurses Home	No Historic Properties Affected	No Historic Properties Affected
6	Former Venetian Hall	No Historic Properties Affected	No Historic Properties Affected
7	Altgeld Gardens Historic District	No Historic Properties Affected	No Historic Properties Affected

NRHP = National Register of Historic Places

As a result of these determinations, no mitigation measures would be required, and consultation with Consulting Parties is considered complete. Coordination with IHPA will continue through the remainder of the project.

Pursuant to the Section 106 implementing regulations at 36 C.F.R. § 800, FTA is seeking State Historic Preservation Officer (SHPO) concurrence with the revised APE, as well as the above eligibility and effects determinations, within 30 days of receipt of this letter.

If FTA can provide any assistance or additional information which would aid in your prompt reply, please feel free to contact Mark Assam, Environmental Protection Specialist at 312-353-4070. Thank you for your assistance.

Sincerely,

Jay M. Ciavarella
Director, Office of Planning & Program Development

Section 1
Summary

This document summarizes information previously provided on the results of technical analysis on potential historic and cultural resources affected by the Chicago Transit Authority (CTA) Red Line Extension (RLE) Project and consultation conducted under Section 106 of the National Historic Preservation Act (NHPA). Because CTA narrowed the selection of alternatives under evaluation during project development (see **Attachment 1**) after Section 106 consultation had significantly progressed, this document has been developed to provide the Illinois Historic Preservation Agency (IHPA) with a streamlined and concise summary of the Area of Potential Effect (APE) for the project and eligibility and effects determinations made to date by the Federal Transit Administration (FTA). All Section 106 findings on alternatives considered that are presented in this document are consistent with previous correspondence and materials provided during the Section 106 consultation process.

1.1 Regulatory Framework

Cultural and historic resources are protected by various federal regulations; Section 106 of the National Historic Preservation Act (NHPA) requires federal agencies to consider effects on historic resources from their actions and to balance preservation needs with the need for the actions. As provided in 36 CFR § 800, the Section 106 process "seeks to accommodate historic preservation concerns with the needs of federal undertakings through consultation" (36 CFR § 800.1(a)). The goal of the consultation is to identify historic properties potentially affected by the undertaking, assess project effects, and seek ways to avoid, minimize, or mitigate any adverse effects on historic properties.

For the Section 106 assessment of historic and archaeological resources, FTA and CTA conducted a four-step process following requirements of 36 CFR § 800:

1. **Define the Area of Potential Effects** - FTA and CTA first determined an APE for cultural/historic resources. The APE is defined as the geographic area within which the project may cause alterations in the character or use of historic properties. Development of the APE involved site visits and a review of aerial photography images and conceptual engineering drawings for the alternative.

2. **Identify Historic and Archaeological Resources** - After an extensive records check, representative samples within the APE footprint were field-surveyed to identify any archaeological resources and historic resources that meet National Register of Historic Places (NRHP) criteria. Representative samples were used to determine effects on similar properties on a block-by-block basis. The properties included in the representative sample were determined using GIS databases provided by the City of Chicago, the Historic and Architectural Resources Geographic Information System, online mapping resources, State Historic Preservation Office (SHPO) records, and field visits. Additional details about the definition of the representative sample, and resources in it, are included in **Section 3** of

this report. NRHP criteria are defined in 36 CFR § 60.4 and apply to districts, sites, buildings, structures, or objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association with one or more of the following four criteria:

- Criterion A - Events that have made a significant contribution to the broad patterns of American history on a federal, state, and/or local level
- Criterion B - Lives of persons significant in the history of the city, state, and/or the United States
- Criterion C - Distinctive characteristics of a type, period, or method of construction, or the work of a master, or high artistic values, or a significant and distinguishable entity whose components may lack individual distinction
- Criterion D - Information important in prehistory or history

FTA and CTA identified properties listed on the NRHP, local landmarks, and Chicago Historic Resources Survey (CHRS) “Red” and “Orange”-rated[1] buildings (properties with locally designated historic importance). FTA and CTA conducted background research to assist this process, using the Historic and Architectural Resources Geographic Information System and city records, fire insurance and other historic maps, the CHRS, previous architectural studies in the area, and other relevant scholarly publications. No properties or districts currently listed on the NRHP are present in the APE.

3. **Assess Effects on Historic and Archaeological Resources** - FTA and CTA assessed effects for each evaluated resource that was listed in the NRHP or determined eligible for listing. The effects analysis included review of specific direct and indirect impacts that were evaluated for the project (for topics such as displacements, noise, and visual impacts) and focused on how the alternative might alter the characteristics that qualify properties for inclusion in the NRHP.

4. **Resolve any Adverse Effects** - FTA and CTA will develop any necessary mitigation measures through consultation with the SHPO and other consulting parties to address adverse effect determinations. Based on the results of the assessment of effects conducted, there would be no adverse effects to historic properties resulting from the project and no additional mitigation measures are proposed.

---

[1] The CHRS is an inventory of architecturally and historically significant buildings in the City of Chicago that uses a color-coded ranking system used to identify historic and architectural significance relative to age, degree of external physical integrity, and level of possible significance. The two highest color codes are "Red" and "Orange." These types of local historic resources are subject to the City of Chicago’s Demolition-Delay Ordinance. “Red” or “Orange”-rated properties were identified as possessing some architectural feature or historical association that made them potentially significant in the context of the surrounding community.

1.2 Section 106 Consultation History and Evolution

In accordance with requirements for consultation established in Section 106 of the NHPA, three distinct rounds of coordination occurred during the RLE Project: initiation activities, identification of historic properties, and assessment of effects. In August 2012, FTA and CTA invited 11 Native American tribes and 19 state and local preservation interest groups to participate in the upcoming consultation process. At present, 11 groups are participating in the process. On October 24, 2012, FTA and CTA held a webinar on RLE historic properties to introduce the project and initiate the consultation process.

As part of the eligibility phase, CTA surveyed 541 potentially eligible resources within the APEs for all alternatives being studied at the time (Bus Rapid Transit [BRT], Union Pacific Railroad [UPRR], and Halsted Alternatives). FTA and CTA provided draft materials on the identification of NRHP-eligible properties to consulting parties on January 4, 2013 and followed it with an in-person meeting on January 30, 2013. As a result of the field investigations and comments received from consulting parties on potentially eligible resources, for all alternatives, 15 total resources were identified as eligible for inclusion on the NRHP, including 13 individual buildings and 2 historic districts.

FTA and CTA mailed a Draft Effects Report to consulting parties on April 18, 2014, requesting any written comments by May 23, 2014. On May 8, 2014, FTA and CTA met with consulting parties to discuss potential project effects on NRHP-eligible historic properties.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Alternative.

CTA had originally considered three alignment options for the UPRR Alternative: the Right-of-Way Option, the East Option, and the West Option. In 2014, the Right-of-Way Option was removed from consideration as it is no longer feasible. This option was added in 2012 in response to the CDOT feasibility study looking at moving UPRR freight operations out of the existing UPRR corridor before the RLE Project. The Right-of-Way Option would only be feasible if the separate project were implemented before implementation of the RLE Project. Coordination between local agencies and the railroads indicted that relocation of UPRR freight operations from this corridor presents considerable challenges; therefore, this option is no longer feasible. Because the Right-of-Way Option is not feasible, the Draft EIS evaluates only the East and West Options for the UPRR Alternative.

Additional conceptual engineering was conducted on the UPRR Alternative to refine the East and West Option alignments. In addition, CTA is now considering only the South Station Option of the 130th Street Station.

CTA provided responses to all consulting party comments received in May 2014 on November 23, 2014. Responses noted that the alternatives had been further narrowed and that the UPRR Alternative (East and West Options) were proposed to move forward as the NEPA Preferred Alternative.

1.3 Organization of this Report

The following sections of this report provide further details on development of the APE and eligibility and effects determinations made and presented during the Section 106 consultation process for this project.

Section 2 of this report provides a brief description of the No Build and Build Alternative (the UPRR Alternative) under consideration and details on identification of the APE.

Section 3 of this report provides a summary of the methodology undertaken to identify potentially affected historic and archaeological resources.

Section 4 of this report provides details on eligible historic and archaeological resources identified.

Section 5 provides details on the effects determinations for the East and West Options of the Build Alternative.

Section 6 summarizes the Section 106 consultation process conducted at each stage of the four-step Section 106 consultation process.

Section 2
Project Description and Area of Potential Effect

The RLE Project would extend the Red Line from the existing 95th Street Terminal to 130th Street. The proposed 5.3-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities.

The RLE Project would reduce commute times for residents, improve mobility and accessibility, and provide connection to other transportation modes. The RLE Project could also foster economic development, where new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts. The RLE Project would also provide a modern, efficient car storage yard and shop facility.

CTA undertook an extensive Alternatives Analysis process from 2006 to 2009 that considered multiple modes and corridor options for the RLE Project. The Chicago Transit Board designated the UPRR Alternative as the Locally Preferred Alternative on August 12, 2009. During 2012–2014 and as part of the Draft EIS analysis, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the BRT Alternative (along Michigan Avenue), the UPRR Alternative, and the Halsted Alternative. CTA evaluated three options for the UPRR Alternative: the Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Alternative 130th Street station: a South Station Option and a West Station Option. The Section 106 analysis and consultation was performed during 2012–2014,on all those alternatives and options. As further described in **Section 2.3**, CTA developed separate APEs for each alternative.

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Alternative. While CTA had originally considered a UPRR Right-of-Way Option, this was subsequently removed as it is no longer feasible. This option was added in 2012 in response to the CDOT feasibility study looking at moving UPRR freight operations out of the existing UPRR corridor before the RLE Project. The Right-of-Way Option would only be feasible if the separate project were implemented before implementation of the RLE Project. Coordination between local agencies and the railroads indicted that relocation of UPRR freight operations from this corridor presents considerable challenges; therefore, this option is no longer feasible.

Because the Right-of-Way Option is not feasible, the Draft EIS evaluates only the East and West Options for the UPRR Alternative. CTA has chosen to move forward with the South Station Option at 130th Street based on technical analysis and public feedback. As further described in **Section 6**, the consulting parties were notified of the NEPA Preferred Alternative in November 2014 as part of the responses to consulting party comments on assessments of effect.

Additional details on the alternatives development process and history, including the entirety of alternatives evaluated between 2012 and 2014 as part of the Section 106 consultation process for this project, are provided in **Attachment 1**.

The Draft EIS focuses on the following alternatives, which emerged from the Alternatives Analysis, NEPA scoping process, and additional technical analysis and public input:

- No Build Alternative
- UPRR Alternative
    - East Option
    - West Option

2.1 No Build Alternative

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of implementing the UPRR Alternative.

The No Build Alternative represents future conditions if the UPRR Alternative were not implemented. The No Build Alternative includes all projects currently included in the fiscally constrained portion of the CMAP FY 2014–2019 Transportation Improvement Program (TIP). Projects in the TIP in the project area include renovation of the 95th Street Terminal, rail line maintenance and improvements, preservation of the North Pullman historic area, road resurfacing, coordination of traffic signal timing, and construction of a new bicycle/pedestrian facility. Impacts related to the construction and operation of the 95th Street Terminal are documented in the approved *95th Street Terminal Improvement Project Environmental Assessment* (CTA 2013b). FTA issued a Finding of No Significant Impact for the 95th Street Terminal Improvement Project in April 2013, and an Amended Finding of No Significant Impact in July 2013. FTA performed an Environmental Assessment Re-Evaluation in July 2016, which confirmed that the Amended Finding of No Significant Impact dated July 2013 remains valid. No new infrastructure would be built as part of the RLE Project under the No Build Alternative.

2.2 Build Alternative

The UPRR Alternative is shown in **Figure 2-1** and would extend the heavy rail Red Line 5.3 miles from the existing 95th Street Terminal to 130th Street. As noted above, the Chicago Transit Board designated the UPRR Alternative as the LPA at its August 12, 2009 board meeting. The UPRR Alternative would reduce transit travel times from the project area to points on the Red Line north of 95th Street (from 130th Street to 95th Street) from 28 minutes to approximately 14 minutes (CTA 2009). The following describe major aspects of the proposed alignment options under consideration, stations, park & ride facilities, 120th Street yard and shop, substations, and overview of the operations plan.

2.2.1 Alignment

Two alignment options adjacent to the UPRR are considered for this alternative: the East Option and the West Option. The CTA elevated structure would be located either east or west of the existing UPRR corridor. The alignment would follow the UPRR corridor to Prairie Avenue, where it would cross over the Canadian National/Metra Electric District (CN/ME) tracks near 119th Street. South of this point, the East and West Options would follow the same alignment southeast along the Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) right-of-way using a portion of the Norfolk Southern Railway and Consolidated Rail Corporation (Conrail) right-of-way to the terminus (end) of the RLE at 130th Street.

As described, two UPRR Alternative options for the segment of the proposed alignment between I-57 and the CN/ME tracks near 119th Street are studied in the Draft EIS:

- East Option - The CTA elevated structure would be placed immediately adjacent to the east side of the UPRR right-of-way.
- West Option - The CTA elevated structure would be placed immediately adjacent to the west side of the UPRR right-of-way.

In the UPRR Alternative, the tracks would be on a new elevated (aerial) track structure from the 95th Street Terminal through the CN/ME track crossing near 119th Street. South of this elevated crossing, the tracks would transition to an at-grade profile (they would continue at ground level).

Figure 2-1: Red Line Extension Project Build Alternative

The proposed elevated structure would be a closed-deck, steel and concrete, aerial track structure with direct-fixation track and welded rail (welded at joints). With direct-fixation track, rails are mounted to specially designed concrete blocks fixed to the concrete deck. Noise barriers (approximately 4 feet in height, measured from the top surface of the concrete deck) are proposed for portions of the structure on both sides of the track deck to reduce noise transmission at and below track level. The structure would vary in height from 14 feet 9 inches to 40 feet above existing grade, depending on required clearances above existing roadways and railroads. The two tracks would have a spacing of 13 feet (13 feet between the track centerlines). The elevated deck, on which the tracks would run, would vary in width from approximately 30 feet to approximately 52 feet at stations

Figure 2-2 is a photo simulation of a typical proposed elevated structure above the UPRR right-of-way. The design shown is conceptual, and the actual design would vary based on further engineering and community input.

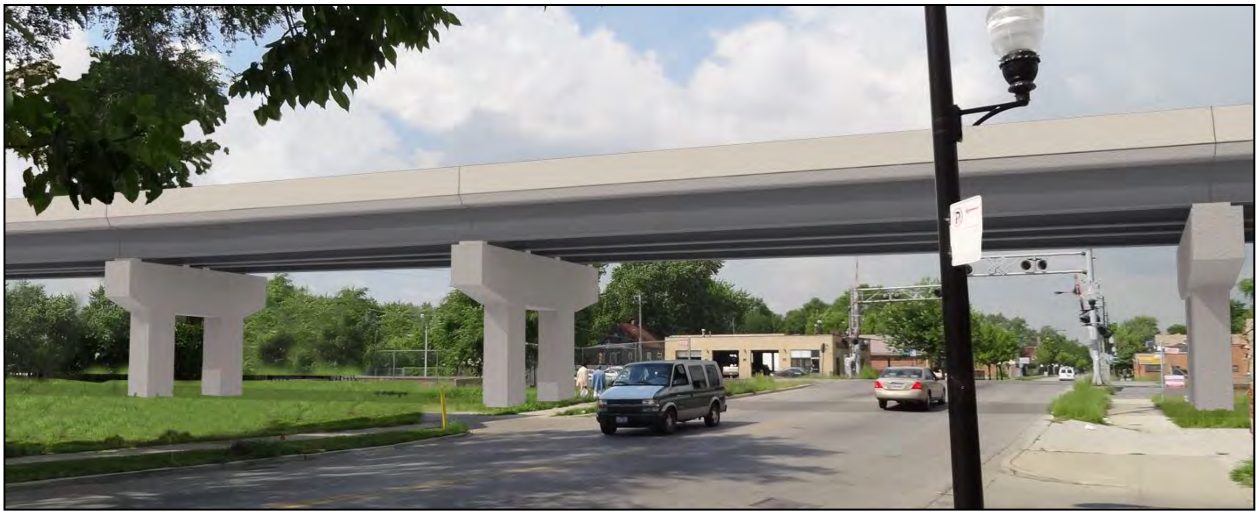

Figure 2-2: Photo Simulation of Union Pacific Railroad Alternative East Option at 111th Street Facing West - Typical Proposed Elevated Structure

2.2.2 Stations

As part of the UPRR Alternative, four new stations would be constructed at the following locations along the proposed alignment:

- 103rd Street (elevated station)
- 111th Street (elevated station)
- Michigan Avenue (elevated station)
- 130th Street (at-grade station)

Each station would have a center platform, approximately 26 feet wide and 520 feet long. Platforms would accommodate ten-car trains. Each station would be Americans with Disabilities

Act (ADA) accessible with elevators. Each station area would include areas for bus boarding, new crosswalks where needed to accommodate pedestrian traffic, and park & ride facilities. **Figure 2-3** is a photo simulation of a typical proposed station. The design shown is conceptual, and the actual design would vary based on further engineering and community input.

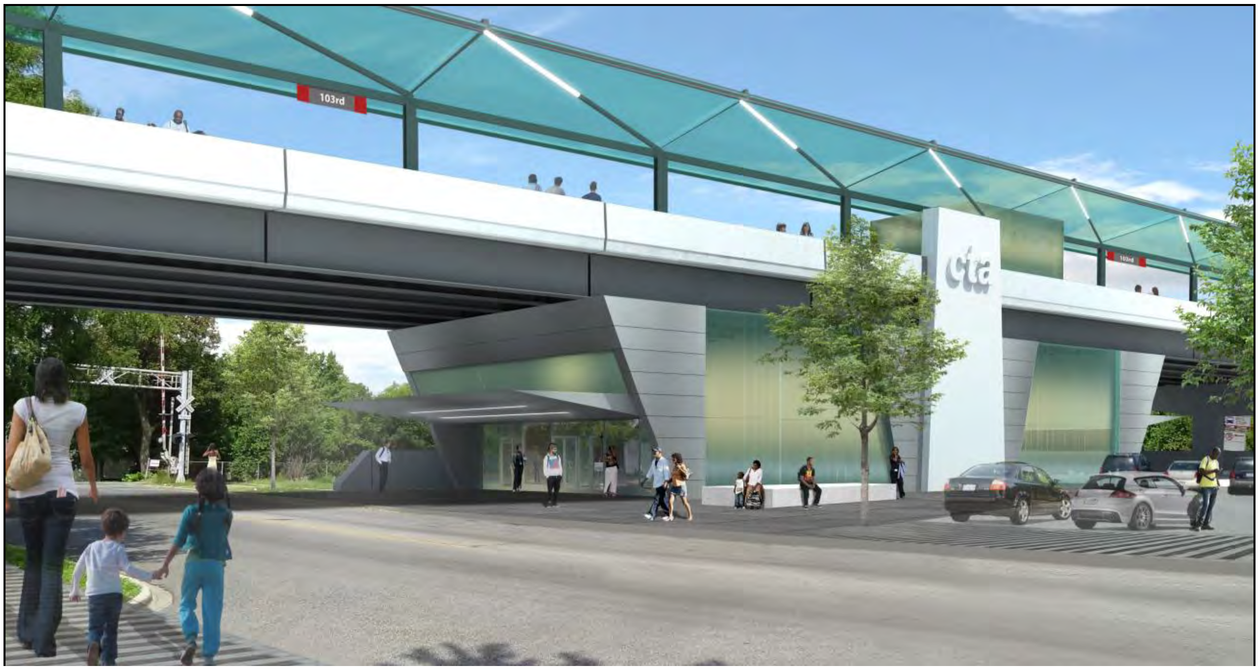

Figure 2-3: Photo Simulation of Union Pacific Railroad Alternative East Option at 103rd Street Facing Northwest - Typical Proposed Elevated Station

The 130th Street station would be located immediately west of the NICTD/CSS & SBRR right-of-way at 130th Street. Pedestrians from Altgeld Gardens would access the station from 130th Place. Pedestrians would not need to cross 130th Street to access the station because 130th Street goes over 130th Place and the railroad tracks.

2.2.3 Park & Ride Facilities

To accommodate passengers arriving at the UPRR Alternative stations by car, park & ride facilities would be constructed near each station, as described in **Table 2-1**. A total of 3,700 parking spaces would be available along the corridor. CTA estimated parking demand based on travel demand modeling performed in 2009. Bus turnarounds would be provided in the parking areas. The ground floor of the parking structure at the Michigan Avenue station would contain space for retail and community facilities.

Table 2-1: Summary of Park & Ride Facilities

Station	Number of Parking Spaces	Union Pacific Railroad Alternative East Option	Union Pacific Railroad Alternative West Option
103rd Street	200	Divided between two surface parking lots (one on the east side of the tracks and one on the west side of the tracks)	One surface parking lot
111th Street	200	Divided between two surface parking lots (one on the east side of the tracks and one on the west side of the tracks)	One surface parking lot
Michigan Avenue	1,000	Divided between a three-story parking structure and a surface parking lot (a surface parking lot on the east of the tracks and a parking structure on the west of the tracks)	Five-story parking structure
130th Street	2,300	Seven-story parking structure	

2.2.4 Yard and Shop

The 120th Street yard and shop, with a capacity of 340 train cars, would be sited on a combination of industrial and vacant land east of the CN/ME tracks and west of the NICTD/CSS & SBRR tracks near 120th Street and Cottage Grove Avenue. The yard would be entirely at grade. Parking spaces for CTA employees would be included at the yard.

2.2.5 Substations

Substations are buildings along the alignment that house equipment to regulate the flow of electricity to the third rail, which supplies power to the trains. Substations would be placed approximately 0.8 to 1 mile apart along the alignment. Six new and upgraded substation locations are proposed: 98th Street Yard and Shop, near 101st Street, near 107th Street, near Lafayette Avenue, within the 120th Street yard and shop area, and near the 130th Street station. CTA would confirm the need and location for substations during future design phases.

2.2.6 Operating Plan

The UPRR Alternative would operate 24 hours a day, each day of the year. Service frequency is anticipated to be the same as with the current service (April 2016) at 95th Street—approximately 6-minute headways during morning peak hours and approximately 3-minute headways during afternoon peak hours. Headways at night (between 1 AM and 4 AM) are approximately 13–15 minutes. Service frequency would be adjusted to accommodate demand once the RLE service has been implemented. Train frequencies would vary throughout the day (like existing Red Line service), and late night service would operate approximately every 15 minutes.

Train sets would be eight cars long. Stations and track alignment would accommodate ten-car trains to maintain the option of running ten-car trains in the future. With the extension of the Red Line, some existing bus routes would be rerouted to feed into the proposed stations.

2.3 Area of Potential Effect

In the context of Section 106, the APE is defined as “the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist” (36 CFR 800.16.d). The APE for the RLE Project was delineated after considering the location of the proposed alternative; the potential for ground disturbance, destruction, or property taking; locations from which the undertaking may be visible and/or audible; and the scale and setting of the project. The APE was developed in consultation with CTA, FTA, and IHPA.

Cultural resource specialists developed the APE boundaries for the BRT, UPRR, and Halsted Alternatives in 2012 after conducting site visits and reviewing the aerial maps and engineering details (such as alignment locations, elevation of the proposed rail line, expected right-of-way limits, and the locations of the yard, stations, and parking facilities) for the Build Alternatives. SHPO concurred on the APE boundaries on July 20, 2012.

Generally, the APEs for the UPRR and Halsted Alternatives contain parcels within one block of the centerline of the alignment. The APE widens to accommodate the locations of each park & ride and the proposed yard and shop beyond the one-block boundary. The APE for the BRT Alternative includes the area immediately surrounding park & ride facilities.

As described above, in August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Alternative. In late 2014, CTA also conducted additional conceptual engineering on the UPRR Alternative to refine the East and West Option alignments. FTA and CTA revised the APE for the UPRR Alternative accordingly and as shown in **Figure 2-4**. The revised APE presents no new effects from the UPRR Alternative than what was presented during consultation. Because the BRT and Halsted Alternatives are no longer under consideration, those APEs are no longer discussed.

Section 3
Methodology for Identification of Resources

3.1 Identification of Historic Resources

3.1.1 Background Research/Historic Context

Background research was conducted to describe the historic context for the project area. Understanding the historic context is essential in establishing the significance of individual properties, and by extension, and NRHP eligibility for the built environment. The following resources were consulted in developing the historic context and identifying known sites:

- The Historic Architectural Resources Geographic Information System (**HARGIS) database** was created by the IHPA in 2003 to manage information about Illinois historic properties; this database documents the state's built environment. The HARGIS database includes data gathered as a result of three statewide survey projects: the Illinois Historic Structures Survey, the Illinois Historic Landmarks Survey, and the Illinois Rural Survey (conducted 1970–1987). The HARGIS database also includes properties identified as part of a NRHP nomination, surveys by local preservation groups, and information from the Illinois Department of Transportation's Bridge Survey. The database includes data forms, photographs, background documentation, and spatial information within a geographical context for each historic property and historic district within the dataset.

- The **CHRS** is an inventory of buildings that was compiled during 1983–1995. The Chicago Department of Housing and Economic Development published its findings in a report titled *Chicago Historic Resources Survey: An Inventory of Architecturally and Historically Significant Structures* in 1996. Organized according to Chicago's 77 neighborhoods, the inventory lists over 17,000 architecturally and historically significant buildings and structures that predate 1940. The information is also available online and is searchable by neighborhood, building address, decade of construction, architect's name, building style and type, survey ranking, and landmark status.

- **Sanborn Fire Insurance maps** contain a wealth of information on the built environment in urban areas. Originally created and maintained to assess fire insurance liability, the maps provide dated contexts in which to describe the development of neighborhoods as well as the compositional components and historical use of individual buildings. Data especially useful for this project include the building footprint, number of stories, foundation material, and cladding material. The Sanborn maps are available online through subscription.

- **NRHP nomination forms** for individually listed historic properties and districts provide a wealth of contextual information for the individual properties and the historic districts. They include construction dates for most historic properties discussed therein and identify the architect in most instances.

Architectural datasets at the local level were reviewed as well, including information from the Commission on Chicago Landmarks.

The Commission on Chicago Landmarks recommends individual buildings, sites, objects, or entire districts to the Mayor and City Council for designation as Chicago Landmarks. To be recommended by the Commission for landmark designation, these resources must meet at least two criteria: (1) being valuable as an example of city, state, or national heritage, and (2) being historically significant—the site of a significant historic event, association with a significant person, architecturally significant, the work of a significant architect or designer, association with a significant historic theme, or a having unique visual feature. In addition, the potential landmark must maintain integrity in light of its location, design, setting, materials, workmanship, and ability to express such historic, community, architectural, or aesthetic interest or value. The Commission reviews any proposed alteration, demolition, or new construction affecting individual landmarks or properties in landmark districts as part of the permit review process. The Commission produces two new publications each year, one for individual landmarks and landmark districts and another for Chicago listings on the NRHP.

Using information in HARGIS and the other sources listed above, a list of previously identified historic and archaeologically-sensitive properties within the RLE APE was compiled and mapped. This effort included the identification of NRHP-listed districts and structures, and any properties identified as local landmarks in Chicago.

3.1.2 Surveys of Historic Resources

After the development of the APE and historic contexts, cultural resources specialists conducted field surveys on two distinct categories of properties: properties that would likely be displaced or demolished as a result of one or more alternatives, and a representative sample of other properties within the APE.

For both categories of properties that were surveyed, cultural resource specialists conducted archival research and photo-documented the exterior of each structure from the public ROW. Each property was assessed for NRHP eligibility using the data gathered during the fieldwork and research phases of the investigation.

The following subsection identifies how the representative sample in the latter category was identified. Because of the developed urban environment and linear nature of the project, effects on properties would be similar for adjacent properties. This method is consistent with November 2011 guidance provided by the Advisory Council on Historic Preservation regarding the "Reasonable and Good Faith Identification Standard in Section 106 Review."

Defining the Representative Sample

To determine the properties to be included in the representative sample, the team's architectural historian relied on the GIS database provided by the City of Chicago, the HARGIS database, online mapping resources, SHPO records, and field reconnaissance. Examining the APE block by block, the historic character of each block was considered, including the following:

- What age are the buildings?
- What types of buildings are present?
- What function(s) do they serve?
- What architectural styles are apparent?
- How does the structure fit the context of the larger neighborhood?

In light of the neighborhood and block level contexts, analysts selected one or more properties per block to represent the range of buildings over 50 years in age throughout the area. In areas where the project would likely cause more substantial effects, a greater concentration of sample properties was selected. More sample properties were selected for heterogeneous blocks (e.g., blocks having a mix of property types and ages) than homogenous blocks. Where multiple similar buildings exist within the block, analysts selected the building with the greatest integrity or most distinguishing architectural features.

For example, block A contains only residential buildings, both Craftsman style bungalows and Minimal Traditional brick homes. Structures date to the 1920s and 1930s. The project would cause moderate effects on the adjacent block, but block A would be screened from the transit line by an existing row of buildings. Analysts therefore selected one bungalow and one Minimal Traditional house from this block. Alternatively, Block B contains a mix of residential and commercial properties, dating from 1902 through the 1950s, plus some modern infill. A mix of architectural styles is present. In this case, analysts selected five structures on this block to represent the cross-section of existing structures.

This process was repeated along the entire APE corridor.

3.2 Identification of Archaeological Resources

Cultural resource specialists conducted a records search to identify archaeological sites within the vicinity of the project area. The **Illinois State Archaeological Survey** (ISAS) GIS database and supporting documentation provides the most comprehensive source for archival background information on archaeological resources. The ISAS conducts multiple-scale field and laboratory research projects that concentrate on interpreting the archaeological heritage of Illinois. Data sources include the Illinois Department of Transportation Historic Bridge Survey and the Cultural Resource Management Archaeological Report Archive, as well as more detailed supporting information including archeological survey data.

This background research included review of artifacts collected by amateur archaeologists Albert Scharf, Oscar Biedes, and Ed Lace, as well as professional investigations completed by the Illinois State Archaeological Survey.

No known archaeological resources were identified within the project APE.

Section 4
Eligible Historic and Archaeological Resources

4.1 Historic Resources

4.1.1 NRHP-Eligible Resources

Figure 4-1 is a map of the APE and the seven identified NRHP-eligible resources. No properties or districts currently listed on the NRHP are present in the APE. **Table 4-1** summarizes historic resources within the APE. The following subsections provide further details on these historic properties. **Attachment 2** provides inventory sheets for NRHP-eligible properties.

Table 4-1: NRHP-Eligible Resources in the Area of Potential Effects

ID	Address	Description	NRHP Eligibility Criteria	Community Area

Figure 4-1: NRHP-Eligible Resources in the Area of Potential Effects

Eclectic Neo-Traditional Home, 444 W. 100th Place

This one-story home in the Washington Heights community area rests on a raised basement as shown in **Figure 4-2**. Built in 1930, it is clad with polychromatic brick and has a side gabled roof covered with asphalt shingles. Its front elevation has a gabled living room bay pavilion with paired basement windows, a group of three non-original one-over-one windows with concrete sills, brick arch lintels, colonettes with acanthus leaf capitals, and a small round-arched window in the gable. The house has a recessed corner porch with a metal storm door, round-arch openings, a Neo-Gothic castellated top, concrete steps, and brick sidewalls. The integrity of its materials and detailing is very good. Its Eclectic Neo-Traditional ornamentation makes it stand out among the vernacular, stripped-down brick and frame bungalows and cottages that comprise the predominant building stock in the Washington Heights community area. As a result, it was identified as individually eligible for NRHP listing under Criterion C for its architecture.

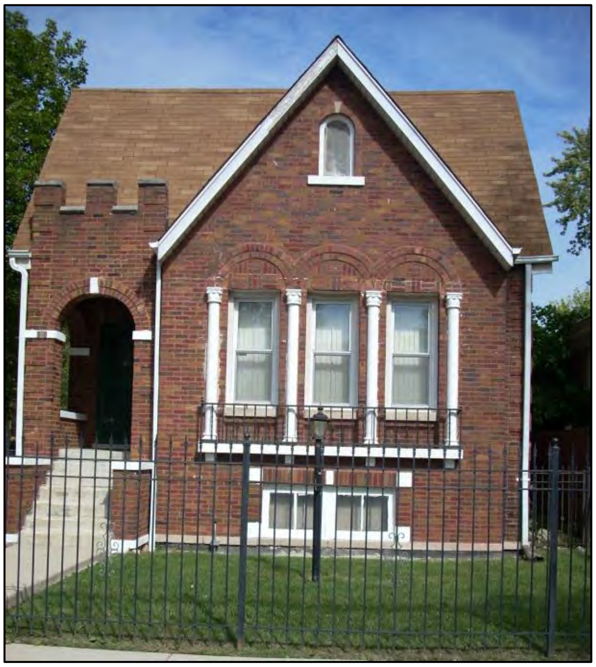

Figure 4-2: South Facade of the Eclectic Neo-Traditional Home at 444 W. 100th Place

Fire Department Engine Company 93, 324 W. 104th Street

This two-story firehouse in the Roseland community area is clad with light brown face brick, as shown in **Figure 4-3**. The building has a flat roof and a parapet with concrete coping. The front elevation has a two-story projecting pavilion, an overhead garage door, two window openings, an off-center, hollow-core metal door on the first floor, and a strip of three windows and a single window on the second floor. All windows are non-original, one-over-one aluminum sash. The spandrel area between the garage door and the windows above features a large stone sign plate inscribed with the words, “City of Chicago Fire Department.” The spandrel area between the corner door and window above has a metal plate identifying the 1917 construction date and the names of a series of people associated with the building’s construction, including the mayor, alderman, city architect (Charles W. Kallal), and contractor (Butler & Co.). Detailing includes stone door and window surrounds on the first floor, bracketed stone window lintels, concrete belt courses, and brick pilasters topped by stone panels with the City of Chicago’s “Y” emblem and decorative scrolls. The “Y” emblem is also repeated above the off-center door.

This building is eligible for individual listing on the NRHP under Criterion C for architecture. It is a rare extant example of an early 20th century neighborhood firehouse in Roseland, has largely retained its original building materials and detailing, and still functions as a firehouse.

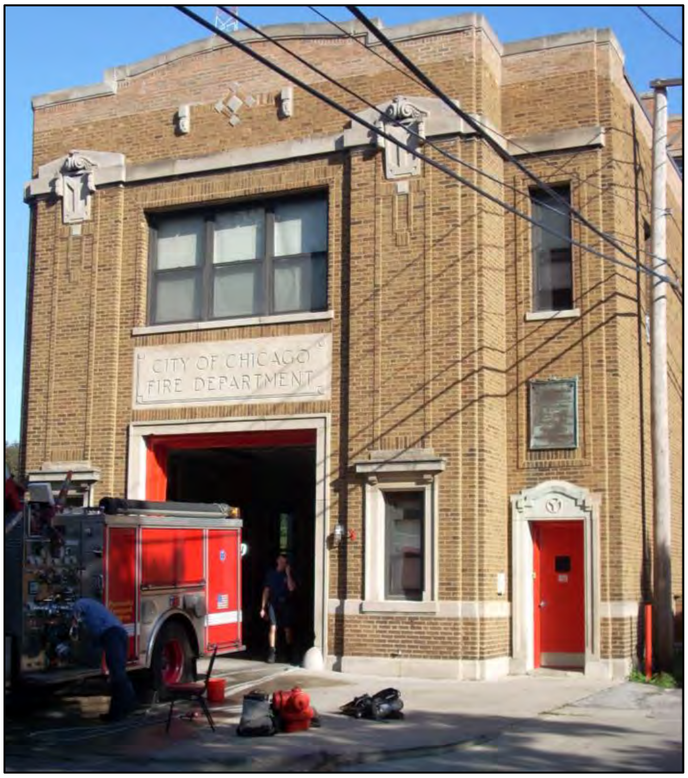

Figure 4-3: South Facade of Chicago Fire Department Engine Company 93

Roseland Pumping Station, 351 W. 104th Street

The two-story Prairie style Roseland Pumping Station, designed by architect William G. Kreig in 1911, is clad in brown brick, as shown in **Figure 4-4**. The building has a high limestone water table, a flat roof, parapet, and two square towers at the corners of the front elevation. The front elevation features a projecting, two-story, flat roofed entrance pavilion with a pair of centrally located glass double doors, sidelights, and a stone panel above that features the City of Chicago's "Y" emblem in metal. The entrance has a smooth stone surround. Above the entrance is a limestone panel incised with the words "City of Chicago Roseland Pumping Station." Detailing on the entrance pavilion includes brick pilasters with stone bases and coping and geometric motifs. The parapet is clad in limestone and features decorative geometric motifs. The building's fenestration is largely composed of multi-paned, steel-sash windows, some of which have transoms.

This is an excellent intact example of a neighborhood pumping station with fine integrity that still functions in its original use. It was identified as individually eligible for the NRHP under Criterion C for architecture, as it stands as an excellent, well-preserved example of a neighborhood pumping station designed in the Prairie style.

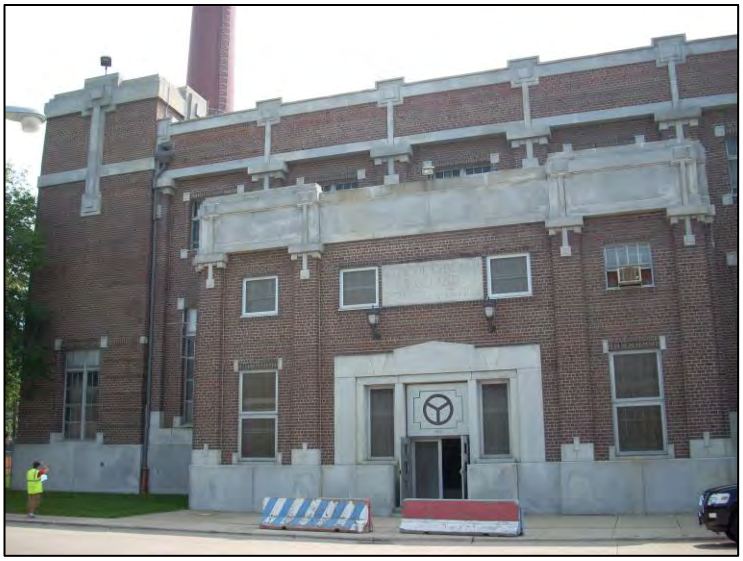

Figure 4-4: North Facade of the City of Chicago Roseland Pumping Station

Romanesque Revival Style Church, 10920 S. Princeton Avenue

This circa 1916 Romanesque Revival style church in the Roseland community area has a front elevation and two flanking towers clad with brown face brick, while the remainder of the side elevation and the rear elevation are clad with common brick. Shown in **Figure 4-5**, the church has a gable roof covered with asphalt shingles and gable wall dormers with shaped parapets on both side elevations. The east tower has a flat roof and a shaped parapet while the west tower has a peaked roof with overhanging eaves and exposed rafters and is topped by a finial. The central bay of the front elevation has a broad, round-arched entrance with a stone surround and two sets of single-light oak double doors. A strip of double-hung windows is within a broad arch and there is a rose window with tracery. Windows on both towers and along the side elevations include round-arch windows with tracery. It is unknown whether the original stained glass for all of these windows is extant inside the church. Both towers also feature paired casement windows. Window openings at the top of the west tower have been boarded over. Detailing includes stone sills, belt courses, brick pilasters, and keystones. A one-story, brick-clad entrance vestibule is along the rear of the west elevation.

Built as the First Reformed Church of Roseland, this church was identified as individually eligible for NRHP listing under Criterion A for its association with the community's once-dominant Dutch population and under Criterion C as a fine example of a Romanesque Revival style church in Roseland.

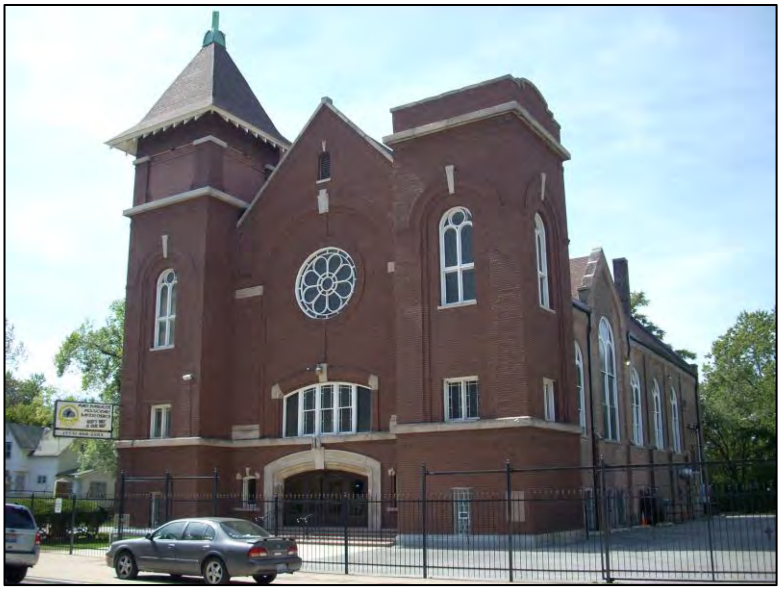

Figure 4-5: East and North Facades of Church at 10920 S. Princeton Avenue

Roseland Community Hospital Nurses Home, 11321 S. Wentworth Avenue

Shown in **Figure 4-6**, this four-story building has a flat roof and parapet. Its symmetrical front elevation is clad with brown face brick and has a centrally located entrance with a glass door and stone surround topped by two stone owls holding books. Windows are non-original one-over-one aluminum sash; those directly above the entrance have stone casings. Detailing includes stone sills, coping, insert blocks, sill courses, cornice, panels, and pinnacles at the parapet level.

This building is locally significant and eligible for NRHP listing under Criterion A for Education. Formerly the Roseland Community Hospital Nurses Home, it was built by the hospital as a dormitory and educational facility for its nurses. Closely affiliated with Roseland Community Hospital, which has served as an important institution in the Roseland area since its establishment in 1924, the Nurses Home is an excellent example of this building type on Chicago's South Side. The exterior of the building has very good integrity and the interior—which now functions as a homeless shelter—appears to retain classrooms and other spaces associated with its original use.

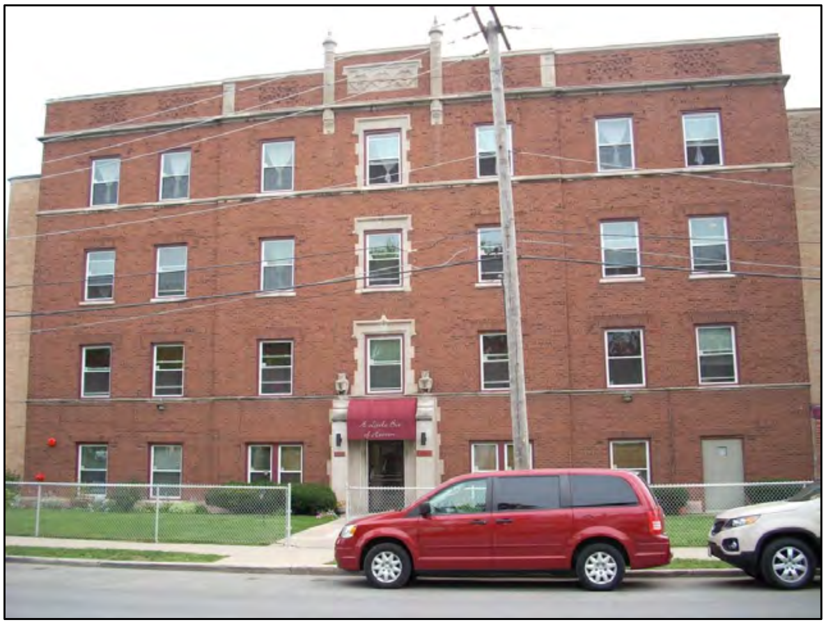

Figure 4-6: Front Facade of Nurses Home at 11321 S. Wentworth Avenue

Venetian Hall, 133–139 E. Kensington Avenue

The two-story performance hall was built for cultural and recreational purposes, although it has long since been repurposed as a church. The 1938 Sanborn map shows the hall with a stage, balcony, and place for storage of scenery. The street entrance was flanked by two storefronts in 1938, as it is today.

Shown in **Figure 4-7**, the 1925 building is clad with face brick on its front elevation and common brick on its side and rear elevations. The building has a flat roof and a shaped parapet with concrete coping. The first floor of the front elevation has a recessed, centrally located bay with three pairs of multi-light wood doors and in-filled transoms. This central bay is flanked by two original storefronts with central recessed doors and flanking display windows that are covered with wood and topped by transoms that have been filled in with glass block. Separating the central bay from the two flanking storefronts and providing access to the second floor are two doors with transoms. The spandrel area directly above the central entrance bay has a concrete sign plate with incised lettering that reads "Venetian Hall." Fenestration on the second floor features six-over-one and three-over-one wood-sash windows arranged in pairs and in groups of three, topped by round-arch stone lintels with rosette motifs. The parapet features a series of Classical shields and swags.

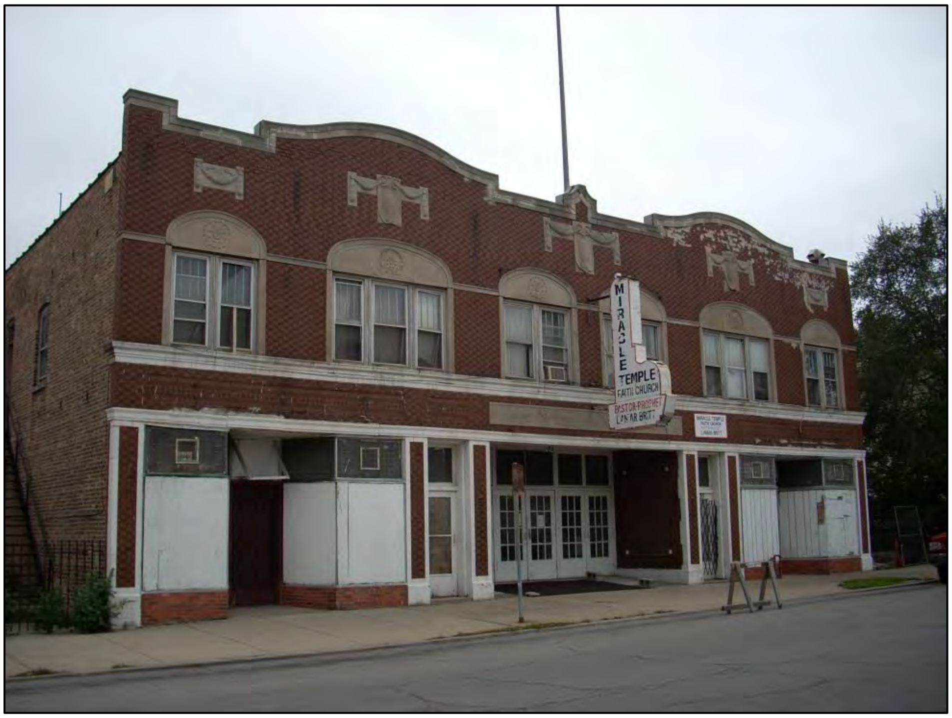

Figure 4-7: Front Facade of Venetian Hall

The exterior of this building has good overall integrity, although elements of the original storefront materials are no longer extant. It does not display sufficient distinguishing architectural features to qualify as individually eligible for listing on the NRHP for its architecture. Instead, it is recommended for individual listing under Criterion A for its original use as a social venue for area residents in the early 20th century. Local theater houses such as the Venetian Hall were jewels within the local communities. It is rare to see an early 20th century neighborhood social hall that retains its original storefronts and is set within a residential area of workers' housing, rather than along a commercial thoroughfare. The opening of Illinois Terra Cotta Works in the first half of the 20th century brought Italians to Kensington; the area gradually became a center of South Side Italian-American life with the establishment of Venetian Hall and the nearby San Antonio de Padua (patron saint of Venice) Roman Catholic Church.

Altgeld Gardens Historic District

This large public housing project was built between 1943–1945 and is shown in **Figure 4-8**. Designed by architects Naess & Murphy, it was originally comprised of 1,498 units located on over 190 acres. Altgeld Gardens is mainly comprised of two-story buildings that are topped with side gable roofs covered in asphalt shingles. The buildings are clad in brick with stepped parapet walls along the gable elevations. A series of single entry doors are located on the front facade. A combination of original and replacement windows are found throughout the complex. Groups of seven units are clustered around central courtyards.

This resource was determined eligible as a district in 1992 by IHPA under Criterion A for its association with community development, planning, and social history.

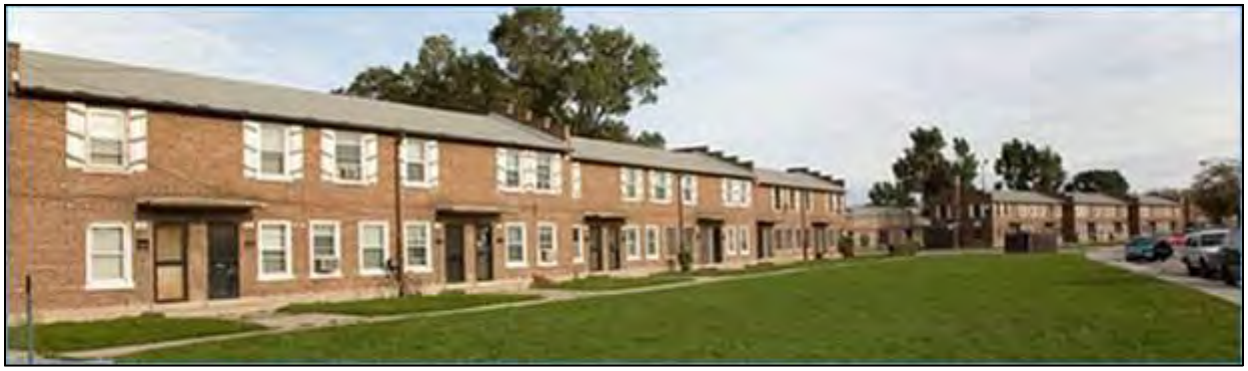

Figure 4-8: Photo of Altgeld Gardens

4.1.2 CHRS Orange-Rated Properties

Beyond the NRHP-eligible resources, four properties within the APE are identified as notable "Orange" in the CHRS, three of which have also been identified as NRHP-eligible:

- Fire Department Engine Company 93 at 324 W. 104th Street (NRHP-eligible, ID #3)
- Roseland Pumping Station at 351 W. 104th Street (NRHP-eligible, ID #4)
- Romanesque Revival-style church at 10920 S. Princeton Avenue (NRHP-eligible, ID #5)
- St. Salomea Church at 11800–11808 S. Indiana Avenue

These CHRS "Orange"-rated resources are protected by the City's 2003 Demolition-Delay Ordinance. As none of the CHRS "Orange"-rated resources are proposed for demolition under either the East or West Option, this ordinance is not discussed further.

4.2 Archaeological Resources

A records search was conducted by cultural resource specialists and no known archaeological sites exist within the APE. Although the landscape through which the transit lines would pass is developed, additional archaeological sites may remain undiscovered within protected locations such as parks and gardens. Once the project design has been further refined and before the Final EIS is published, archaeological investigations will occur within areas of ground disturbance for the selected option to determine whether potential resources are present. These investigations will follow the guidelines issued by the State of Illinois.

Section 5
Effects Determinations and Mitigation

5.1 Effect Analysis Thresholds

The NHPA establishes qualitative criteria that define whether a historic property would be subject to an adverse effect: when a project "may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association" (36 CFR 800.5.a). Based on this regulatory framework, an adverse effect finding will be applied to any historic property that would be subject to one or more of the following (36 CFR 800.5.a.2):

- Physical destruction or damage to all or part of the archaeological resource or historic property
- Alteration that is inconsistent with the Secretary of the Interior's *Standards for the Treatment of Historic Properties*
- Removal of the property from its historic location
- Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant features
- Change to the character of the property's use or the physical features within the property's setting that contribute to its significance
- Neglect of a property that causes deterioration
- Transfer, lease, or sale of property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation

Effects can be direct, indirect, or cumulative. If an adverse effect is found, the Federal Transit Administration (FTA) would consult with the Illinois Historic Preservation Agency (the SHPO for Illinois) and other interested parties to develop and evaluate alternatives or modifications to the undertaking that could avoid, minimize, or mitigate adverse effects on the resource (36 CFR 800.6.a).

Effects determinations from the No Build and Build Alternative are provided below.

5.2 No Build Alternative

No adverse effects on historic and cultural resources would result from implementation of the No Build Alternative; therefore, no mitigation measures would be required.

5.3 Build Alternative – UPRR Alternative

Table 5-1 summarizes the effects findings for each historic resource in the APE for both the East and West Options.

Table 5-1: NRHP-Eligible Resources in the Area of Potential Effects - Union Pacific Railroad Alternative East and West Options

ID	Description	Union Pacific Railroad Alternative East Option Effects Finding	Union Pacific Railroad Alternative West Option Effects Finding
1	Eclectic Neo-Traditional Home	No Historic Properties Affected	No Historic Properties Affected
2	Fire Department Engine Company 93	No Historic Properties Affected	No Historic Properties Affected
3	Roseland Pumping Station	No Adverse Effect	No Historic Properties Affected
4	Romanesque Revival-Style Church	No Historic Properties Affected	No Historic Properties Affected
5	Roseland Community Hospital Nurses Home	No Historic Properties Affected	No Historic Properties Affected
6	Former Venetian Hall	No Historic Properties Affected	No Historic Properties Affected
7	Altgeld Gardens Historic District	No Historic Properties Affected	No Historic Properties Affected

NRHP = National Register of Historic Places

5.3.1 East Option

The East Option would cause displacements and visual, noise, and other environmental effects within the APE, but none of these effects would alter the characteristics that qualify any of the identified historic resources for inclusion on the NRHP. No mitigation measures would be required. Because none of the NRHP-eligible resources in the APE would be directly affected (they would not be displaced), each resource was evaluated for potential visual effects from the aerial structure, stations, and parking facilities.

Figure 5-1 is a photo simulation of the East Option track structure adjacent to the Roseland Pumping Station. Although the track structure would be approximately 9 feet west of the Roseland Pumping Station at its nearest point, the East Option is anticipated to have no adverse effect. The pumping station would not be displaced or directly affected by the UPRR Alternative. The resource was recommended eligible under Criterion C for its architecture as an excellent example of a well-preserved community pumping station designed in the Prairie Style that still functions in its original use. The building retains much of its original design, materials, and workmanship, including its projecting two-story flat-roofed entrance pavilion with geometric limestone details and coping. The proposed project would not affect these characteristics and would preserve the property's entrance approach. The changes in setting and feeling brought on by the proposed project would not detract from the architectural aspects of the building that qualify the resource as eligible for NRHP listing. Pile-driving activities would be avoided in the vicinity of the pumping station.

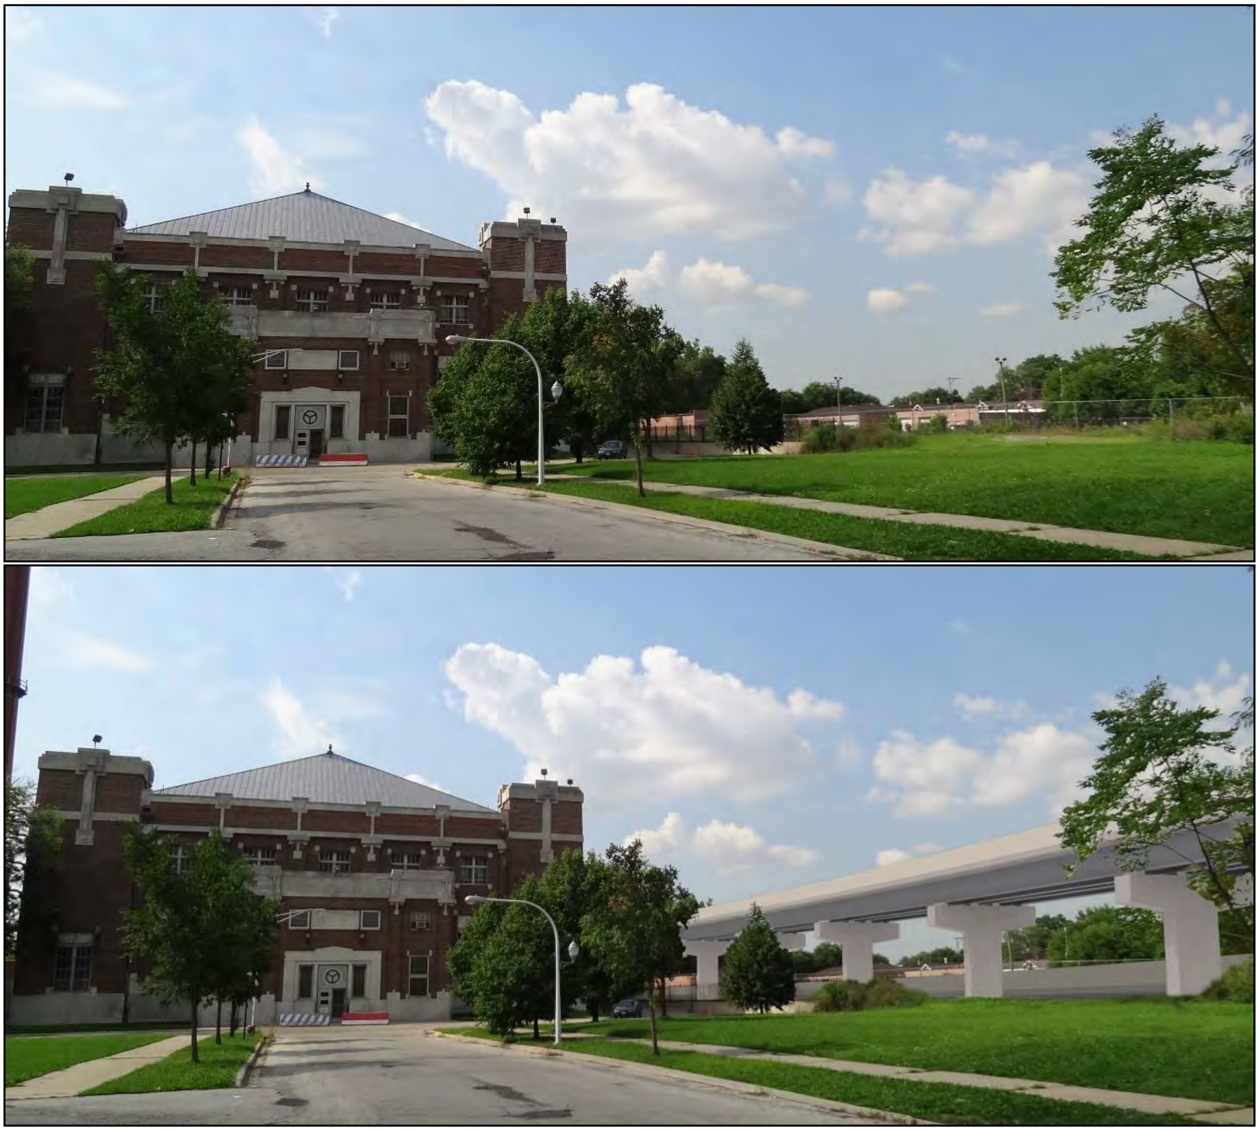

Figure 5-1: Photo of Existing Conditions and Photo Simulation of the Union Pacific Railroad Alternative East Option Elevated Track Structure adjacent to the Roseland Pumping Station, Facing South on Harvard Avenue

The 130th Street station would be approximately 800 feet from Altgeld Gardens Historic District at its closest point and the parking garage at the 130th Street station would be located at a distance away from Altgeld Gardens where the size of the structure would not create a visual impact; therefore, the 130th Street station and parking garage would not affect the Altgeld Gardens Historic District. **Figure 5-2** shows a view of the 130th Street station and parking structure from Altgeld Gardens.

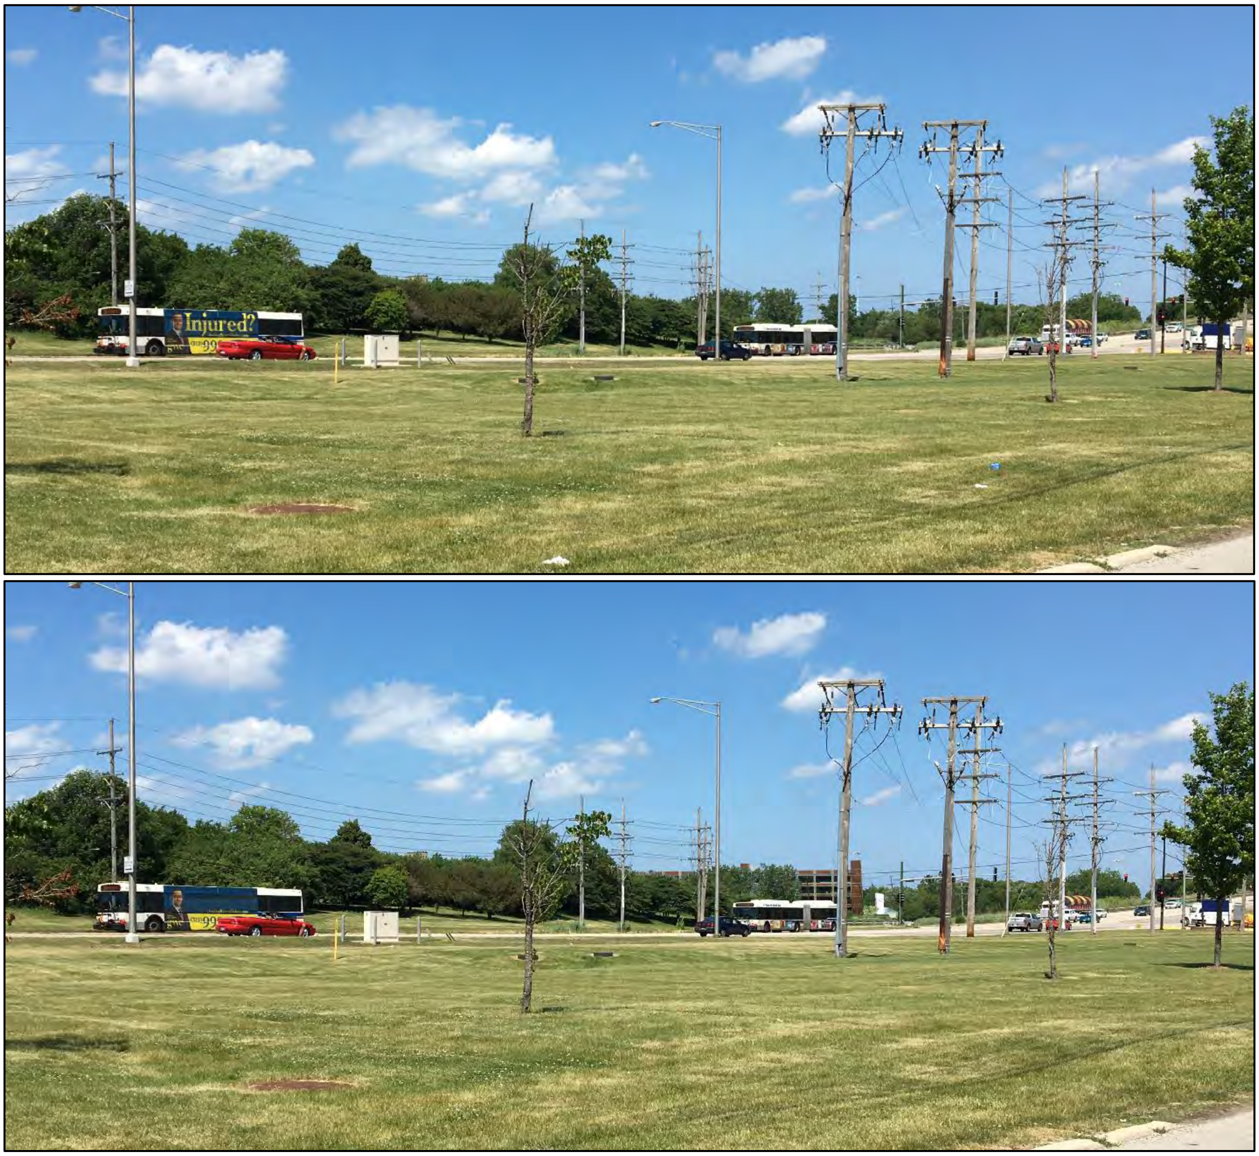

Figure 5-2: Photo of Existing Conditions and Photo Simulation of the 130th Street Station and Parking Garage, Facing Northeast on 130th Place

5.3.2 West Option

Like the East Option, the West Option would cause displacements and visual, noise, and other environmental effects within the APE, but none of these effects would alter the characteristics that qualify any of the identified historic resources for inclusion on the NRHP. No mitigation measures would be required.

Section 6
Consultation Process

In accordance with requirements for consultation established in Section 106 of the NHPA, three distinct rounds of coordination occurred during the RLE Project: initiation activities, identification of historic properties, and assessment of effects. Because there would be no adverse effects as a result of this project, no additional coordination for resolution of adverse effects was needed. Each outreach effort is described in the following sections. **Attachment 3** contains copies of meeting notes from each of these meetings, comments received from consulting parties, and responses to comments.

6.1 Initiation Activities

6.1.1 Invitations to Participate

In August 2012, FTA sent invitation letters to 11 Native American tribes to inform them of the process and request assistance in identifying areas with potential cultural and/or religious significance. Also in August 2012, CTA sent invitation letters to 19 state and local preservation interest groups to inform them of the project and invite them to participate in the upcoming consultation process. FTA and CTA sent invitation letters to the following recipients:

Native American Tribes

- Ho-Chunk Nation
- Miami Tribe of Oklahoma
- Peoria Tribe of Indians of Oklahoma
- Sac and Fox Nation of Oklahoma
- Pokagon Band of Potawatomi Indians
- Prairie Band of the Potawatomi Nation
- Citizen Potawatomi Nation
- Forest County Potawatomi Nation
- Potawatomi Nation
- Sac and Fox Nation of Mississippi in Iowa
- Sac and Fox Nation of Missouri

State and Local Preservation Groups

- SHPO
- Advisory Council on Historic Preservation
- Illinois State Museum
- Illinois State Archaeological Survey
- City of Chicago Department of Planning and Development's Historic Preservation Division
- Preservation Chicago
- Landmarks Illinois
- Chicago Historical Society
- Ridge Historical Society
- Beverly Area Planning Association
- East Beverly Association
- Rosemoor Community Association
- Cottage Grove Cottage Grove Heights Community Coalition
- Historic Pullman Foundation
- South Suburban Genealogical and Historical Society
- Chicago Neighborhood Initiatives
- Neighborhood Housing Services of Chicago
- Mercy Housing Lakefront
- Friends of the Parks

At present, 11 groups are participating in the process. The consulting parties include the SHPO, the City of Chicago Department of Planning and Development's Historic Preservation Division, Preservation Chicago, Landmarks Illinois, the Ridge Historical Society, the Rosemoor Community Association, Friends of the Parks, Chicago Neighborhood Initiatives, Neighborhood Housing Services of Chicago, DCP, and the Chicago Park District.

6.1.2 Section 106 Kickoff Webinar

On October 24, 2012, FTA and CTA held a webinar on RLE historic properties to introduce the project and initiate the consultation process. During the eligibility phase of consultation, properties and districts that were identified as eligible for listing on the NRHP were discussed. Properties over 50 years old in the APE were evaluated to determine whether they are NRHP-eligible under one of the four National Park Service Criteria for Evaluation.

6.2 Identification of Historic Properties

FTA and CTA provided draft materials on the identification of NRHP-eligible properties to consulting parties on January 4, 2013, in compliance with Section 106 of the NHPA. A 30-day comment period followed, with an in-person meeting on January 30, 2013 to facilitate discussion among consulting parties. The meeting was followed by an informal tour of the corridor that afternoon. As part of this phase of coordination, CTA received written comments from six consulting parties.

Comments received from consulting parties in regards to eligibility focused on requesting additional surveys of resources, potential districts that should be considered recommended as eligible, reconsideration of surveyed properties and their eligibility, and the importance of looking at resources in the historical/social context.

As part of the eligibility phase, CTA surveyed 541 potentially eligible resources within the APEs for all alternatives being studied at the time (BRT, UPRR, and Halsted Alternatives). As a result of the field investigations and comments received from consulting parties on potentially eligible resources, for all alternatives, 15 total resources were identified as eligible for inclusion on the NRHP, including 13 individual buildings and 2 historic districts.

Specifically for the UPRR Alternative, CTA surveyed 280 potentially eligible resources within the UPRR Alternative APE. As a result of the field investigations and comments received from consulting parties on potentially eligible resources, for the UPRR Alternative, 7 total resources were identified as eligible for inclusion on the NRHP, including 6 individual buildings and 1 historic district.

6.3 Assessment of Effects

FTA and CTA mailed a Draft Effects Report to consulting parties on April 18, 2014, requesting any written comments by May 23, 2014. On May 8, 2014, FTA and CTA met with consulting parties to discuss potential project effects on NRHP-eligible historic properties. CTA received written comments from four consulting parties.

Comments received from consulting parties in regards to assessments of effect included eligibility reconsiderations, effects reconsiderations, and requests for renderings for properties in the APE. Comments also related to effects associated with the Halsted Alternative and 130th Street West Station Option, both of which have been eliminated from further consideration.

As discussed above in Section 2, in August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Alternative. Additional conceptual engineering was conducted on the UPRR Alternative to refine the East and West Option alignments. In addition, CTA is now considering only the South Station Option of the 130th Street Station. Further details on the alternatives evaluated and eliminated through the Draft EIS process are provided in **Attachment 1**.

CTA provided responses to all consulting party comments received in May 2014 on November 23, 2014. Responses noted that the alternatives had been further narrowed and that the UPRR Alternative (East and West Options) were proposed to move forward as the NEPA Preferred Alternative. The consulting parties requested renderings at the Roseland Pumping Station and the 130th Street station near Altgeld Gardens, which are included in the Draft EIS.

6.4 Resolution of Adverse Effects

Based on the assessment of effects and review of consulting party comments, CTA recommends that no adverse effects on historic resources would occur because of the RLE Project (East or West

Option); no mitigation measures would be required and therefore consultation with consulting parties is complete. Coordination with the SHPO will continue through the remainder of the project.

Attachment 3: Section 106 Consultation Supporting Documentation

Attachment 1
Alternatives Development Process

CTA began developing the alternatives studied in the Draft EIS during the Alternatives Analysis (AA), which took place during 2006–2009. Starting with multiple modes and corridor options, CTA developed and screened alternatives through a combination of conceptual engineering, public input (open house and stakeholder meetings), and preliminary analysis of potential impacts and costs. A three-level, detailed screening process was used to evaluate the alternatives and identify an LPA. The LPA Report provides detailed documentation of the Screen 1, Screen 2, and Screen 3 evaluations.

The Screen 1 evaluation began by identifying the universe of alternatives, which included a wide range of transit modes (such as bus, rail, or streetcar), project area corridors, and profiles (where the transit line is in relation to the ground). Combinations of 11 modes, 9 corridors, and 4 profiles were evaluated against the purpose and need. Based on this evaluation, the following alternatives were carried forward for further analysis in Screen 2: two bus rapid transit (BRT) alternatives along Halsted Street and Michigan Avenue; six heavy rail transit (HRT) alternatives along Halsted Street, the Union Pacific Railroad (UPRR), and Michigan Avenue; the No Build Alternative; and a “low cost” alternative (formerly required for FTA analyses known as the Transportation System Management [TSM] Alternative).

The alternatives carried through to the Screen 2 evaluation were more thoroughly defined to include mapping of a more defined alignment, identification of potential station locations, and preliminary service plans. Station spacing was determined by the type of alternative proposed, project area needs, and consistency with the purpose and need. The eight evaluation factors for the Screen 2 included a mix of qualitative and quantitative factors intended to further evaluate the performance of each alternative with respect to the project goals and objectives. Specific evaluation factors included physical constraints; right-of-way requirements; social and economic factors; demographics and employment; environmental factors; noise, visual, natural, and cultural resource impacts; transportation factors; and travel time, transit connectivity, and traffic.

Based on the results of the Screen 2 evaluation, a BRT alternative along Halsted Street (operating on dedicated lanes), two HRT alternatives along Halsted Street and the UPRR, the No Build Alternative, and the TSM Alternative were recommended for further evaluation in Screen 3. In addition to the alternatives carried forward from the Screen 2 evaluation and based on discussions with FTA, CTA combined the TSM Alternative with a BRT alternative (operating on existing right-of-way rather than dedicated lanes as proposed in Screen 2) along Michigan Avenue to form a single alternative (called the BRT Alternative) for evaluation in Screen 3. Because the Michigan Avenue BRT Alternative would operate in the existing right-of-way, it would require fewer property acquisitions than BRT on dedicated lanes. Screen 3 was a two-step evaluation process that included the further definition and refinement of alternatives, including conceptual design and the evaluation of these alternatives. Nine evaluation factors were used to evaluate the alternatives as part of Screen 3, including physical constraints, public support, social and economic factors, environmental factors, transportation factors, capital cost comparison, operating and maintenance cost comparison, ridership potential, and FTA's Cost Effectiveness Index. The result of the Screen 3 evaluation was a recommendation for the LPA: the UPRR Alternative.

Based on the results of the AA and considerable public support for the corridor, including a 2004 referendum where 38,000 residents in the 9th and 34th Wards supported the UPRR corridor for the RLE Project, the UPRR Alternative was recommended as the LPA, indicating that it is the alternative that would best meet the purpose and need of the project while addressing potential impacts and other potential constraints. The UPRR Alternative would provide access to the most densely populated portions of the study area, which are primarily residential and transit supportive. The Chicago Transit Board designated the UPRR Alternative as the LPA on August 12, 2009. **Figure 1** summarizes the AA process.

[2] This Draft EIS presents impacts of the No Build Alternative and two options of the UPRR Rail Alternative: the East Option and the West Option.

EIS = Environmental Impact Statement, UPRR = Union Pacific Railroad

Figure 1: Alternatives Development Summary

After the AA, CTA further refined the alternatives for presentation during the NEPA scoping process and study in the Draft EIS. At the conclusion of the AA process, the UPRR Alternative was anticipated to be located adjacent to the east or west edge of the UPRR right-of-way. In 2012, CTA learned of a Chicago Department of Transportation (CDOT) feasibility study looking at moving UPRR freight operations out of the existing UPRR corridor before the RLE Project. By moving UPRR freight operations out of the existing UPRR corridor, CTA could use the existing UPRR right-of-way for the RLE Project. CTA evaluated this new option of the UPRR Alternative, known as the Right-of-Way Option, in preparation of the Draft EIS. Subsequent coordination between local agencies and the railroads indicated that relocating UPRR freight operations from this corridor presents considerable challenges and would not be feasible.

During 2012–2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the BRT Alternative (along Michigan Avenue), the UPRR Alternative, and the Halsted Alternative. CTA evaluated three options for the UPRR Alternative: the Right-of-Way Option, East Option, and West Option. CTA also evaluated two options for the UPRR Alternative 130th Street station: a South Station Option and a West Station Option.

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Alternative. Because the Right-of-Way Option is not feasible, the Draft EIS evaluates only the East and West Options for the UPRR Alternative. CTA has chosen to move forward with the South Station Option at 130th Street based on technical analysis and public feedback. Additional information about the BRT Alternative, UPRR Right-of-Way Option, UPRR West Station Option for the 130th Street station, and Halsted Alternative is presented below in the discussion of alternatives considered but not pursued.

Alternatives Considered but Not Pursued

During development of the project, CTA fully evaluated the BRT Alternative, the Right-of-Way Option for the UPRR Alternative, and the Halsted Rail Alternative (Halsted Alternative). In addition, CTA fully evaluated a West Station Option for the 130th Street station. These alternatives and the station option were analyzed as part of the technical memoranda preparation for the Draft EIS, but are not included in the Draft EIS. They were eliminated from analysis based on public input, technical constraints, potential impacts, and the extent to which they met the project's purpose and need.

CTA also evaluated a variation of the UPRR Alternative where the tracks would be at grade rather than elevated, described below.

Bus Rapid Transit Alternative

CTA considered a BRT Alternative along Michigan Avenue between 95th Street Terminal and Altgeld Gardens. This limited-stop enhanced bus route along the existing #34 South Michigan Avenue bus route would have transit signal priority along Michigan Avenue. The alternative included four stops, each with park & ride facilities. Although the BRT Alternative was a lower-cost alternative than the UPRR Alternative, it was eliminated in August 2014 based on public feedback including the following concerns:

- The BRT Alternative would have minimal travel time improvements compared to the No Build Alternative (23 minutes from 130th Street to 95th Street under the BRT Alternative, compared to 28 minutes for existing conditions or 14 minutes for the UPRR Alternative over the same distance).
- Approximately 1 million riders per year were anticipated for the BRT Alternative (in comparison to 13 million riders per year anticipated for the UPRR Alternative).
- The BRT buses would not have traveled on a dedicated lane along Michigan Avenue because of limited right-of-way. Although transit signal priority was planned, additional travel time savings would not have been realized without dedicated lanes for BRT buses.

Union Pacific Railroad Alternative

The Draft EIS summarizes the benefits and impacts of the East and West Options. In preparation of the Draft EIS, CTA fully evaluated the Right-of-Way Option and the 130th Street Station West Station Option. CTA also considered an at-grade (rather than elevated) track structure for the UPRR Alternative.

Right-of-Way Option

As part of the UPRR Right-of-Way Option, the elevated CTA structure would have been placed in the UPRR right-of-way. This option was added in 2012 in response to the CDOT feasibility study looking at moving UPRR freight operations out of the existing UPRR corridor before the RLE Project. The Right-of-Way Option would only be feasible if the separate project were implemented before implementation of the RLE Project. Coordination between local agencies and the railroads indicted that relocation of UPRR freight operations from this corridor presents considerable challenges; therefore, this option is no longer feasible. Estimated travel times and ridership were the same for the Right-of-Way Option as for the East and West Options. Because the elevated CTA structure would have been placed in the UPRR right-of-way, the Right-of-Way Option would have resulted in fewer displaced properties than either the East or West Option.

130th Street Station - West Station Option

CTA initially considered two options for the 130th Street station: a South Station Option and a West Station Option. The South Station Option would be located immediately west of the

Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) right-of-way at 130th Street. The West Station Option would be located along the north side of 130th Street at Evans Avenue. Pedestrians from Altgeld Gardens would access the West Station Option through a pedestrian crosswalk on 130th Street. A traffic signal would be required at this intersection to allow pedestrians to safely cross 130th Street.

The South Station Option is supported by the community and the Chicago Housing Authority because it would be more accessible from Altgeld Gardens. The West Station Option would incur additional costs because it would require approximately 1,100 feet of additional track due to its location, and would require intersection improvements to allow pedestrians to safely cross the street. The South Station Option would provide the best opportunity for a future connection to NICTD, improving regional rail connections and linkages to other modes of public transportation. Based on public feedback and technical analysis, CTA is considering only the South Station Option for 130th Street station.

At-Grade Track Structure

CTA considered a variation of the UPRR Alternative in which the RLE tracks would run at grade along the UPRR rail corridor (between I-57 and Prairie Avenue). In this variation, the existing east-west roadways would run either above or below the new at-grade CTA tracks and the existing at-grade UPRR tracks. Like the proposed UPRR Alternative, this variation would be elevated from the 95th Street Terminal to south of I-57, then at grade from I-57 to Prairie Avenue, elevated to cross the Canadian National/Metra Electric District (CN/ME) tracks near 119th Street, then at grade near the proposed yard and shop and 130th Street station. CTA evaluated potential impacts and cost implications to run the east-west roadways both above (using overpasses) and below (using underpasses) the at-grade UPRR tracks and the proposed at-grade CTA tracks.

Roadway Overpasses

For an at-grade track structure, one option would be to use overpasses to carry roadways over the tracks. If roadway overpasses were used, they would need to be constructed at eight locations. More than 100 properties (primarily residential homes) would be displaced due to the overpass footprint, elimination of access to existing alleyways or driveways, and proximity of the embankment structure to the residential homes. The overpass structure and associated embankment could be as high as 30 feet, creating a substantial visual impact on the adjacent one-story residential buildings. In addition, permanent north-south residential street closures would be required where the streets would intersect with the embankment, which would disrupt neighborhood connectivity. Utilities that currently run within the street rights-of-way would have to be relocated. The potential construction cost savings between the elevated track structure and the at-grade structure would be insignificant when the cost of additional right-of-way acquisition and utility relocations is included. Roadway overpasses would also increase community impacts.

Roadway Underpasses

A second option for an at-grade track structure would be to use underpasses to carry roadways under the tracks. If underpasses were used, they would need to be constructed at eight locations. The underpass variation would have property displacements and community impacts similar to those of the roadway overpass option except a large retaining wall would be located in front of the residential homes. Because the cost of a roadway underpass structure may be as much as double the cost of an overpass structure, this variation would provide no additional cost savings over the elevated track structure alternative and would have significantly more community impacts and right-of-way costs.

Based on the property displacements and community impacts that would be created by grade-separating the roadways from the proposed CTA tracks (through either roadway overpasses or underpasses), CTA eliminated this variation from further consideration.

Halsted Alternative

CTA considered the Halsted Alternative, which would extend the Red Line from 95th Street Terminal along I-57, and south along Halsted Avenue to Vermont Avenue on a new elevated structure. The Halsted Alternative would run above Halsted Avenue with center piers, except at the station locations where the structures would span Halsted Avenue. The Halsted Alternative would result in travel times similar to those of the UPRR Alternative. The alternative included four stations, each with park & ride facilities. Construction costs for the Halsted Alternative were approximately 6 percent higher than for the UPRR Alternative. The Halsted Alternative was eliminated in August 2014 based on technical analysis and public feedback including the following concerns:

- The Halsted Alternative would not have the potential for a direct connection to other regional transit services[2] like the UPRR Alternative would; therefore, it would not meet the purpose and need for the project.
- The Halsted Alternative would affect four historic resources, resulting in adverse effects on historic properties, while the UPRR Alternative would not affect any historic resources.
- The proposed seven-story parking structure at Vermont Avenue would result in adverse visual impacts because of its location within a neighborhood with single-family homes.
- The Halsted Alternative would not directly serve as many affordable housing locations in the project area as the UPRR Alternative would serve, including Altgeld Gardens.
- The public expressed concern that implementation of the Halsted Alternative would be disruptive to the surrounding community and would increase shadows, crime, and noise along the Halsted Street.

---

[2] Although the Halsted Alternative intersects the ME Blue Island branch, the southern terminus of that branch is less than 3 miles from the intersection at Halsted Street and is located just to the west of the project area. The northern terminus of the ME Blue Island branch is only two blocks from the Red Line in the Loop. Intersection with the ME Blue Island branch would not provide regional service.

- The Halsted Alternative did not receive the considerable public support before and during scoping in 2009 that the UPRR Alternative received.

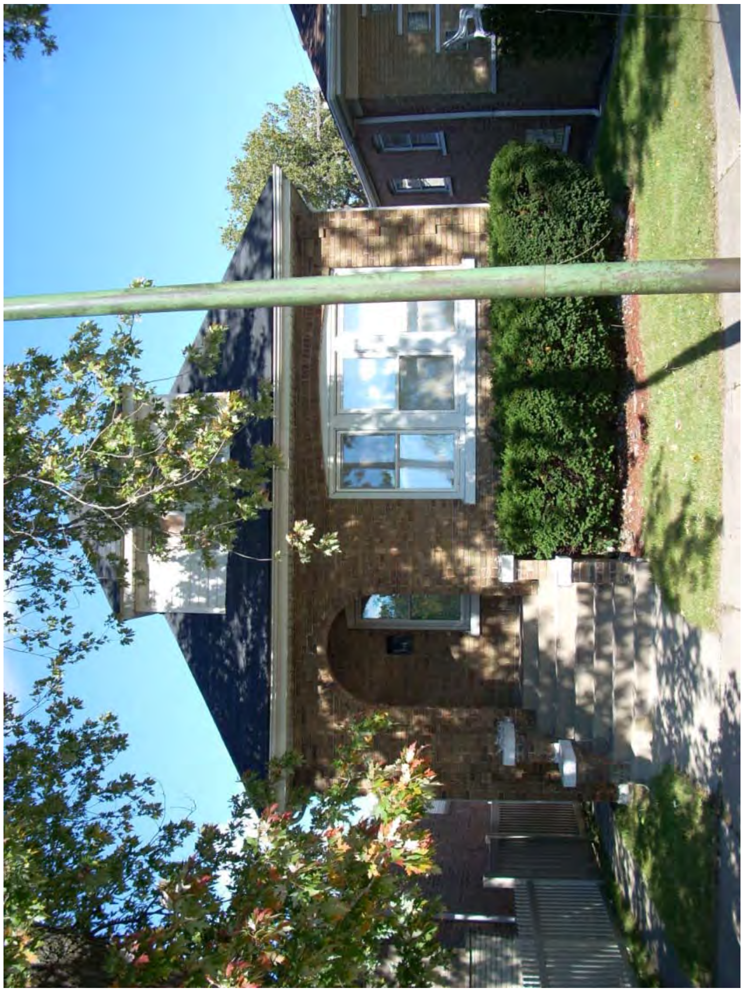
South façade of a one-story, single family, brick residence.



Property Description: **Stories:** 1

This one-story brick bungalow in the Washington Heights community is clad with tan face brick on its front elevation, common brick on its side elevations, and synthetic siding on its rear elevation. It has a steeply pitched hip roof covered with asphalt shingles and synthetic-clad, hip roof dormers with paired one-over-one windows on both the front and rear elevations. The front elevation has a recessed corner porch with round-arch opening, low brick sidewalls, and concrete steps. The residence also includes a door tucked into the side of the living room bay and four one-over-one windows, three of which are grouped together under a segmental arch. All windows are modern replacements with aluminum sashes. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

This one-story house in the Roseland community is situated on a raised brick basement and has a front gable roof covered with asphalt shingles. Its front elevation is clad with buff brick and has a projecting gabled living room bay. This elevation also has a centrally located entrance with a metal storm door, concrete steps, metal railings, a bracketed shed-roofed door hood, and four six-over-one windows: three on the first floor and one in the gable. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

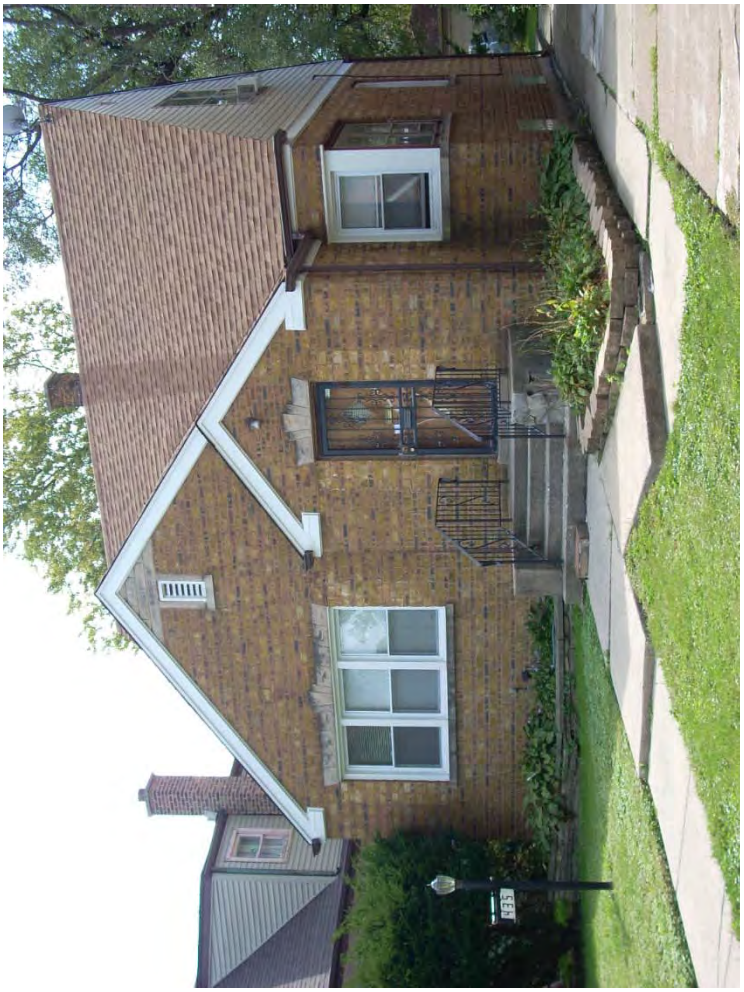
North façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story house in the Washington Heights community is clad with polychromatic brick and has a side-gabled roof covered with asphalt shingles. End gable walls are clad in aluminum siding. Its front elevation features a gabled pavilion with a strip of three non-original one-over-one aluminum-sash windows and a gabled entrance vestibule featuring a wood door with diamond pane window, concrete steps, and metal railings. A single non-original one-over-one aluminum-sash window is located in the corner of the front elevation. A small ventilating louver is situated in the gable. Detailing includes concrete sills and lintels with keystones. This house does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

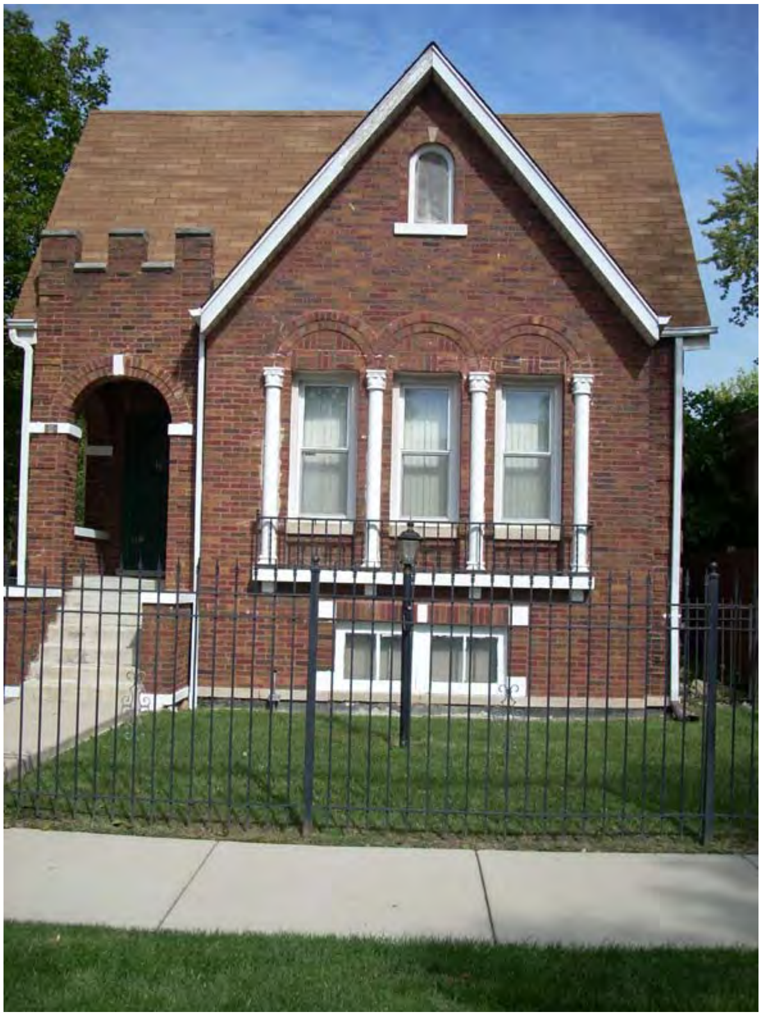
South façade of a brick one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story house in the Washington Heights community sits on a raised basement. It is clad with polychromatic brick and has a side gabled roof covered with asphalt shingles. Its front elevation has a gabled living room bay pavilion with paired basement windows that appear to be casements. There is a group of three non-original one-over-one windows with concrete sills and brick arch lintels that are separated by colonettes with acanthus leaf capitals. A small round-arched window is located in the gable. The house has a recessed corner porch with a metal storm door, round-arch openings, a Neo-Gothic castellated top, concrete steps, and brick sidewalls. This house has very good integrity in terms of its materials and detailing, and its Eclectic Neo-Traditional ornamentation makes it stand out among the vernacular, stripped-down brick and frame bungalows and cottages that comprise the predominant building stock in the Washington Heights community. As a result, it is recommended as individually eligible for National Register listing under Criterion C for architecture.

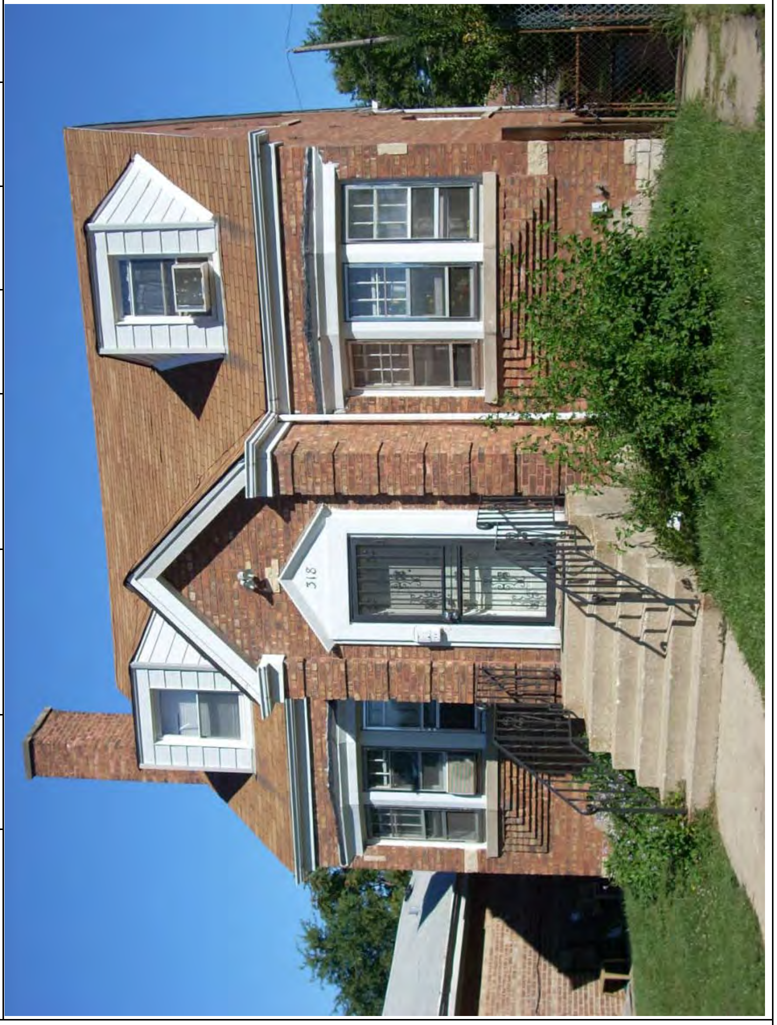
North façade of 1.5-story, brick, single family residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story brick-clad home has a steeply pitched side gable roof covered with asphalt shingles, an exterior brick chimney, and two aluminum-clad shed dormers, each of which has a single one-over-one aluminum-sash window (non-original). Its front elevation has a centrally located gabled front vestibule with brick quoins, a door with wood surround and pediment, and concrete steps with metal railings. The entrance is flanked by three-sided window bays, which feature six-over-one windows with decorative brick corbelling beneath. It does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

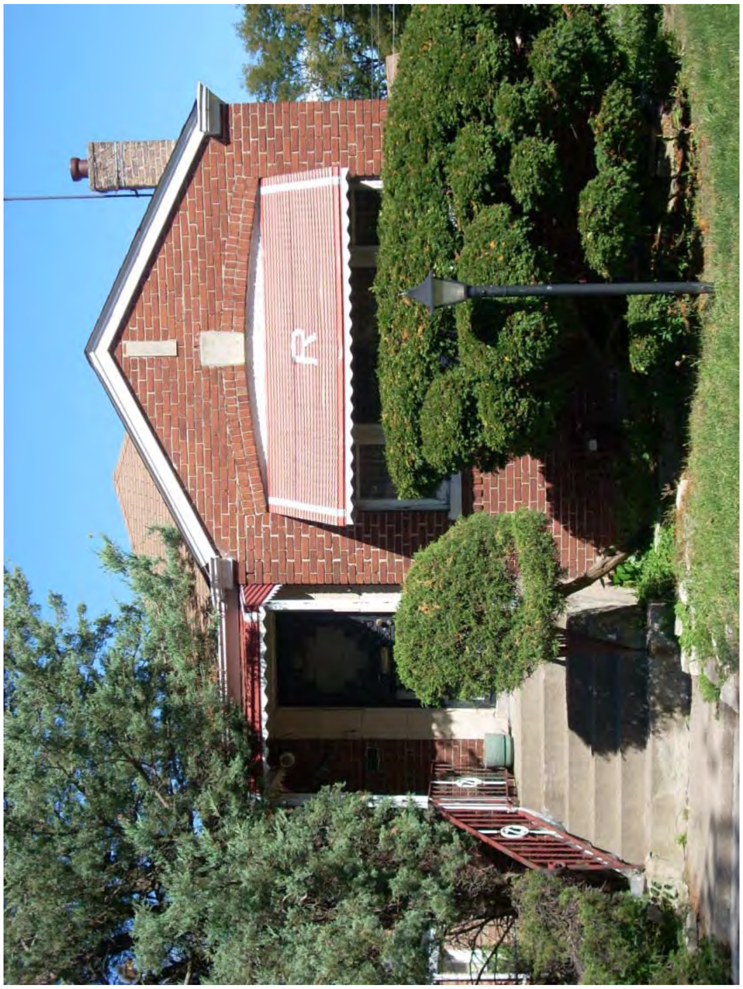
South façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story house in the Roseland community has a hip roof covered with asphalt shingles and a projecting gable-roofed living room. The front elevation is clad with brownish-orange face brick. Its off-center entrance features a metal storm door and a porch with concrete steps, metal railings and open metal posts supporting a metal awning. The front elevation has a window grouping that is partially obscured by a low metal canopy but appears to be a picture window flanked by double-hung windows. The side elevations are clad with common brick. Detailing includes a brick arch with stone keystone above the front elevation window group and stone blocks surrounding the door. This house does not feature sufficient distinguishing architectural elements to be individually eligible for listing on the National Register.

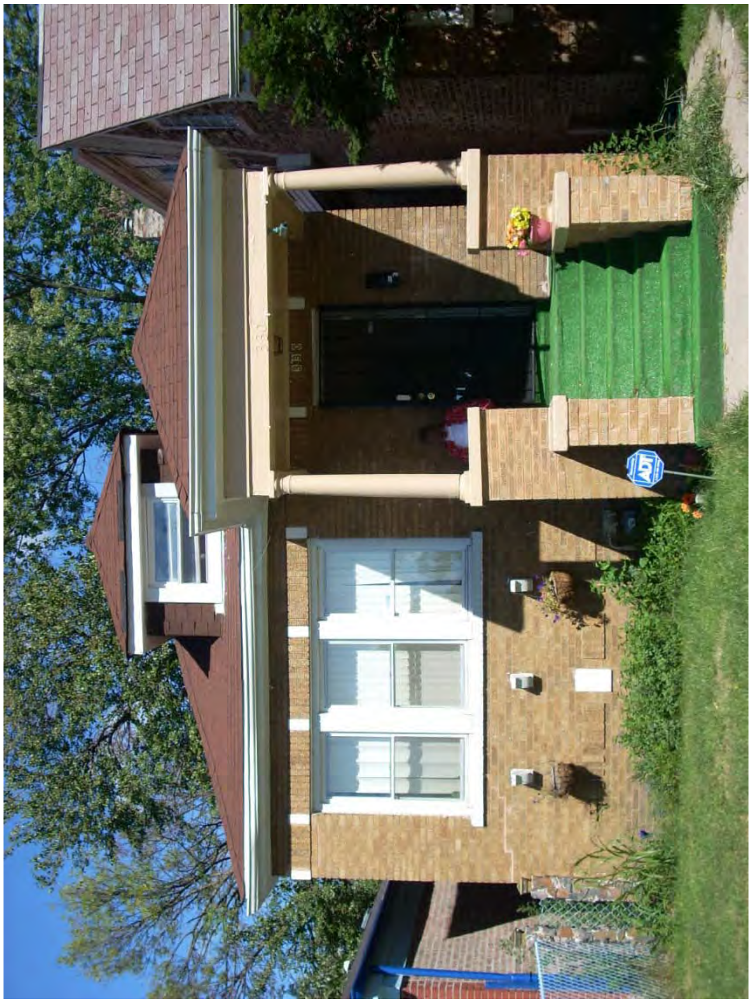
South façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story bungalow in the Roseland community has a hip roof covered with asphalt shingles and a hip dormer with a non-original one-over-one aluminum-sash window. The front elevation is clad with light brown face brick and has a hip-roofed porch with brick sidewalls, concrete steps, short wood Doric columns and frieze band. This elevation also has a strip of three non-original one-over-one aluminum-sash windows. Detailing includes a stone sill course, a brick soldier course with stone insert blocks above the windows, and decorative scrolled stone brackets. This house does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

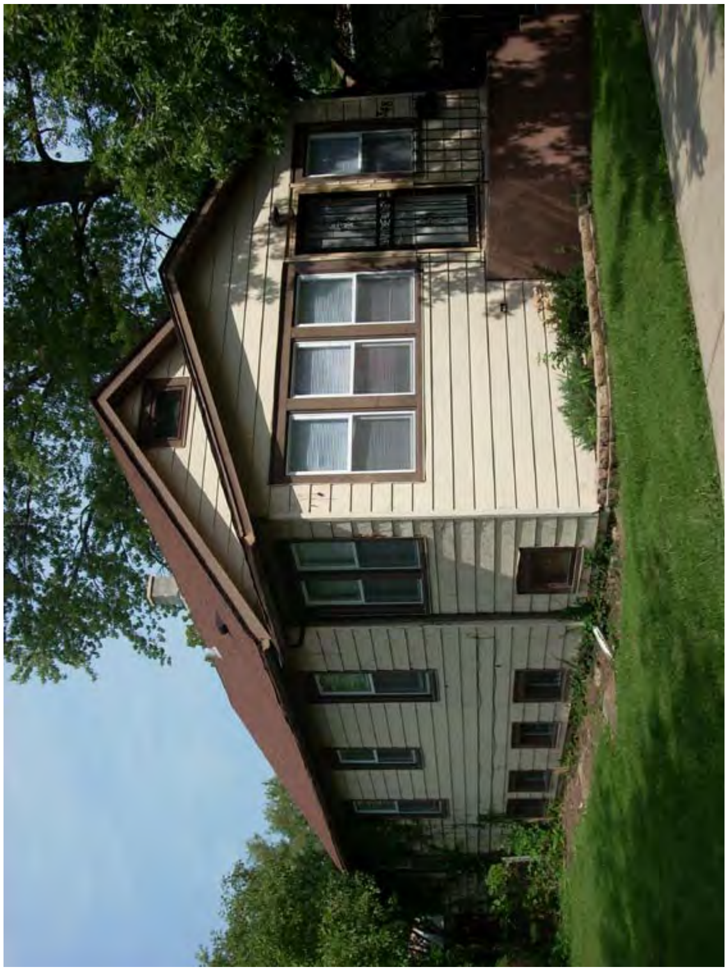
South and west façades of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story house in Roseland is clad in synthetic siding, sits atop a raised basement, and has a front gable roof covered with asphalt shingles. The front elevation features a projecting, enclosed, gable roofed sun porch also clad in synthetic siding with one-over-one windows and an off-center front door accessed by a flight of concrete steps with metal railings. This home does not have distinguishing architectural features and is covered with synthetic siding, both of which preclude it from individual listing on the National Register.

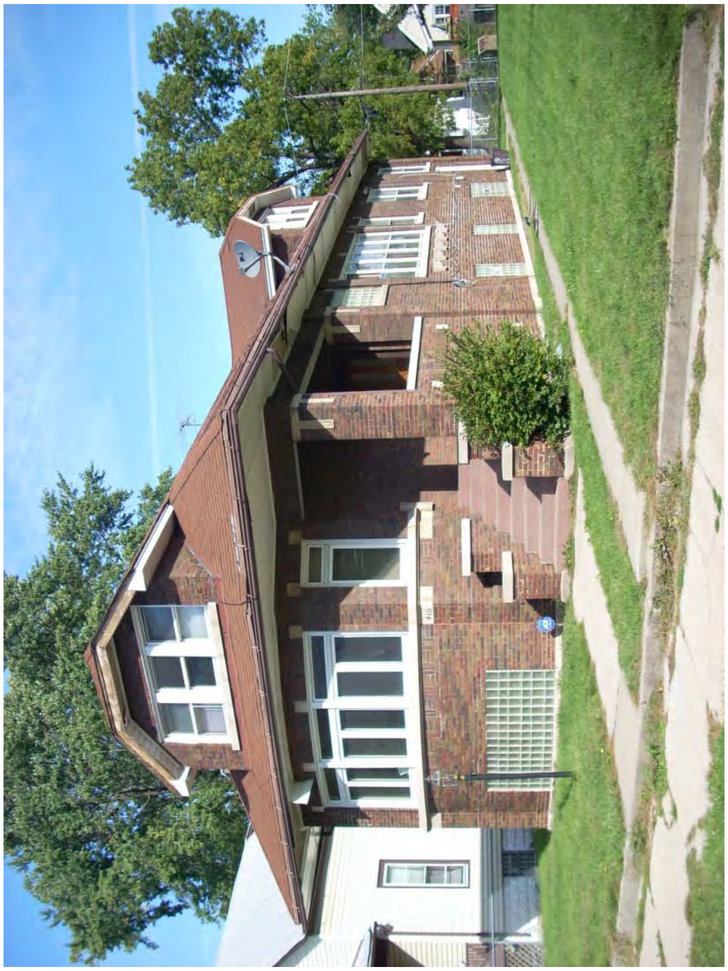
South and east façades of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story house in the Washington Heights community is situated on a raised basement with glass block windows. It is clad with brown brick and has a hip roof covered with asphalt shingles and overhanging eaves. There are hip-on-gable dormers on the front and side elevations, each of which has a strip of non-original one-over-one aluminum-sash windows. The house features a recessed corner porch with a single-light oak door, concrete steps, low brick sidewalls, and a brick corner pier. The front elevation’s rounded living room bay has a series of casement windows and transoms. Detailing includes a brickwork soldier course above windows with decorative stone insert blocks and concrete sills. This is a good example of a brick Chicago Style Bungalow, a building type that was produced in the thousands throughout the city’s undeveloped areas and in nearby suburbs during the 1910s and 1920s. This house does not feature sufficient distinguishing architectural features to be individually eligible for listing on the National Register.

Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community has a cross-gable roof covered with asphalt shingles and is clad with brown face brick. Its front elevation has an off-center, gable roofed entrance vestibule with a metal storm door sheltered by a metal awning, concrete steps, metal railings, and paired double-hung windows on both the first and second floors that are partially obscured by low metal awnings. A one-story hip roof covered side entrance is situated along the west elevation. Detailing includes concrete sills, a keystone above the entrance, and brick soldier course lintels. This house does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

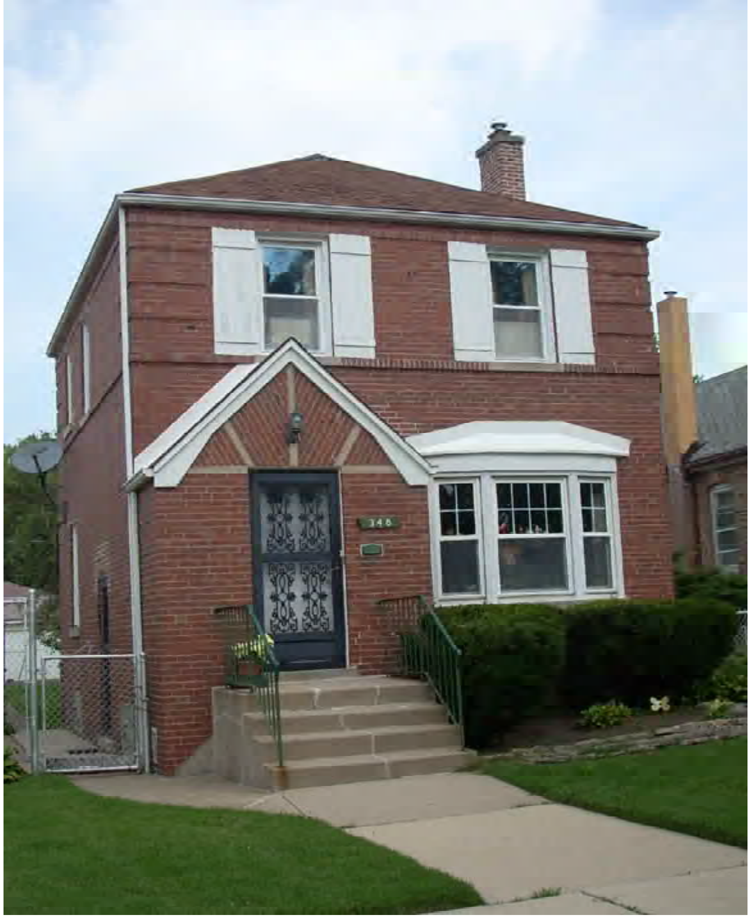
South façade of brick, two-story, single family residence.



Property Description: **Stories:** 2

This two-story, brick-clad house in Roseland has a square footprint and a hip roof covered with asphalt shingles. An off-center, projecting, gable-roofed vestibule with front door is accessed via a short flight of concrete steps with metal railings. The front elevation has a three-sided bay with a central eight-over-one window flanked by four-over-one windows, and the second floor has two one-over-one windows with wood shutters. Windows are modern replacements. Detailing includes brick banding on the second floor and concrete bands in the vestibule gable meant to simulate half-timbering. This house lacks architectural distinction; as a result, it is not individually eligible for listing on the National Register.

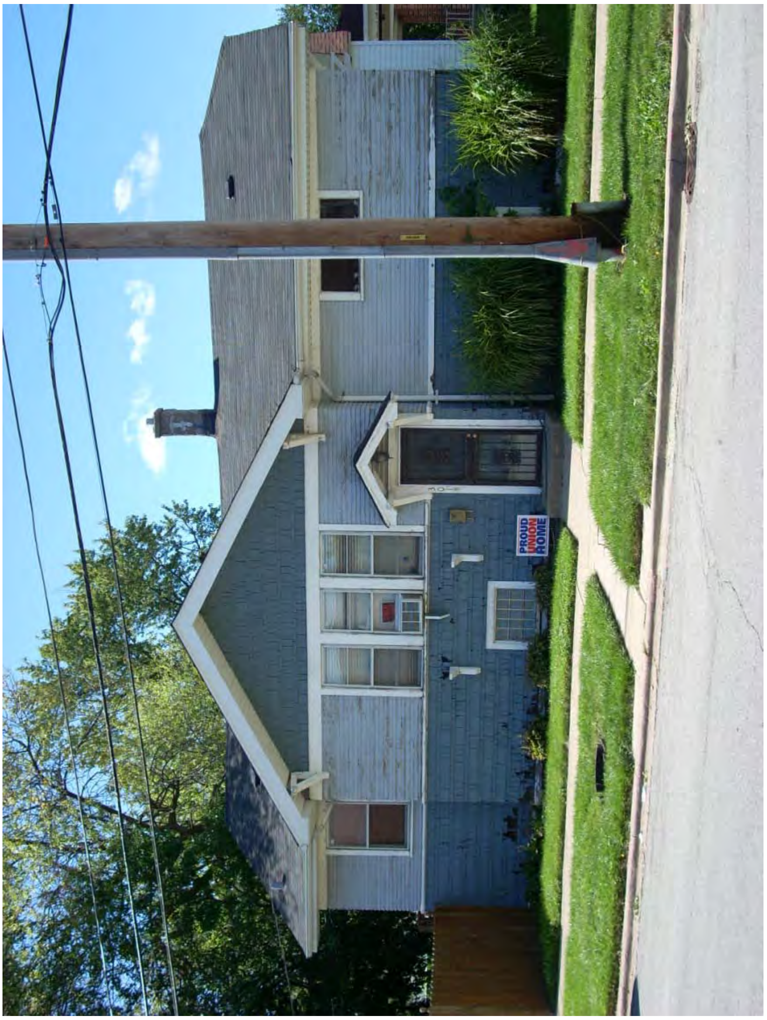
East (Princeton) façade of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman bungalow is situated at the southwest corner of 103rd Place and Princeton Avenue in the Roseland community. It has a hip-on-gable roof covered with asphalt shingles and overhanging eaves with decorative knee braces located on the front gable section of the roof. The central portion of the house retains its original wood clapboard siding; the areas above and below are clad with wood shingles. Its 103rd Place elevation has a strip of three one-over-one windows, a strip of three casements, and a strip of three windows in the gable that appear to be casements. Its Princeton Street elevation has a metal storm door topped by a gabled hood with two knee braces, glass block basement windows, a strip of three one-over-one windows, a single one-over-one window, and a pair of casements. This house does not have sufficient distinguishing features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story frame cottage in the Roseland community is clad with synthetic siding, has a side-gabled roof covered with asphalt shingles, and has two gable dormers with double-hung multi-sash windows that are visually connected with aluminum siding. The front elevation has an off-center door covered with plywood and a Classical surround consisting of simple wood pilasters and unadorned entablature. The front elevation also has concrete steps with metal railings and paired windows that are covered with plywood. This home does not have distinguishing features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1.5

This one-and-a-half-story frame cottage in the Roseland community is situated on a raised brick basement with glass block windows. It is clad with aluminum siding and has a side-gabled roof covered with asphalt shingles. The house also has a gable dormer with a strip of one-over-one windows and decorative knee braces. Its front elevation has a partial-width, off-center, gable-roofed, wood porch with two squat Doric column supports atop aluminum-clad sidewalls, a door with metal storm, and a picture window flanked by one-over-one windows. Its western elevation has a three-sided window bay as well as a large shed roofed addition. This house does not have sufficient integrity or distinguishing features to qualify as individually eligible for listing on the National Register.

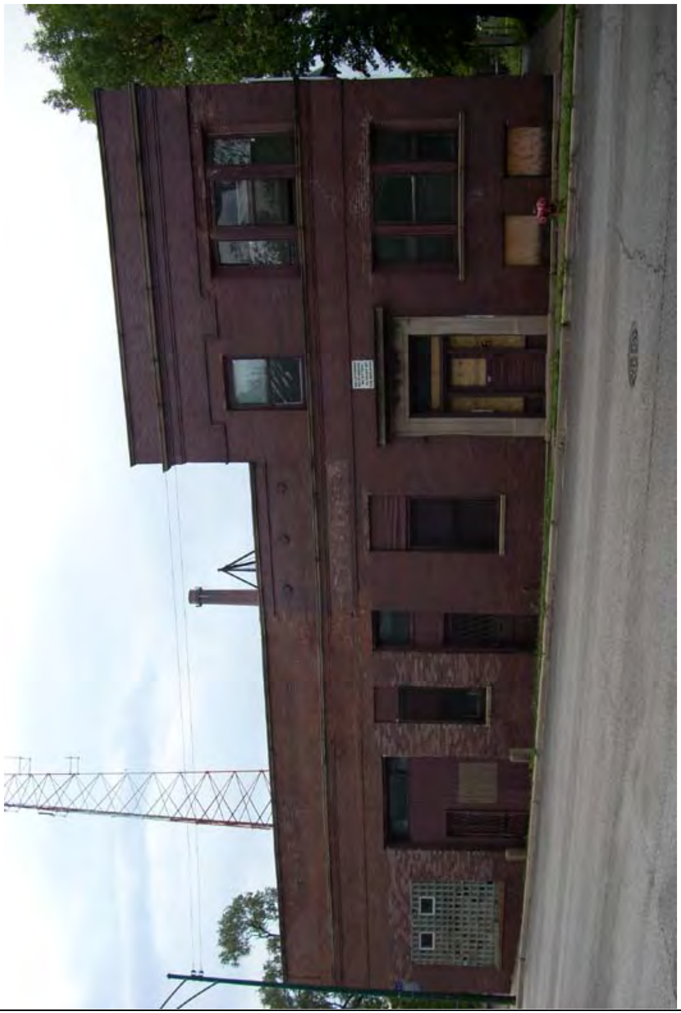
North façade of a brick, commercial building.



Property Description: **Stories:** 2

The two-story commercial portion of this building is identified as a “Hay, Grain & Feed” shop in the 1905 Sanborn while the one-story portion is identified as used for related storage. The buildings were joined at a later date. Both are clad in brown face brick and have flat roofs and parapets. The two-story section has an off-center entrance with an original wood door, sidelights, transom, and a stone surround with cornice, as well as a metal cornice. The glass panes in the sidelights and door have been removed and their openings in-filled with wood. It has bay windows on the first and second floors and an additional window opening above the entrance bay. All windows are comprised of one-over-one wood-sash. Detailing includes brick banding and a stone cornice. The one-story part has altered door and window openings, including one large window opening that has been in-filled with glass blocks. Side elevations are clad in common brick. This structure lacks architectural distinction and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story frame building in the Washington Heights community has a gable roof covered with asphalt shingles that is obscured by a false front with faux stone siding and high stepped parapet. The first floor has two large window openings that are in-filled with glass block. The second floor has a non-original picture window flanked by one-over-one aluminum-sash windows. The building has a one-story flat-roofed wing. The wing's front elevation is clad with vertically laid wood boards above a brick base. It has a pair of non-original hollow core metal paneled doors with fanlights. The wing also features decorative modern angled wood pylons at its corner and along its side elevation. This building does not feature sufficient integrity to qualify as individually eligible for listing on the National Register.

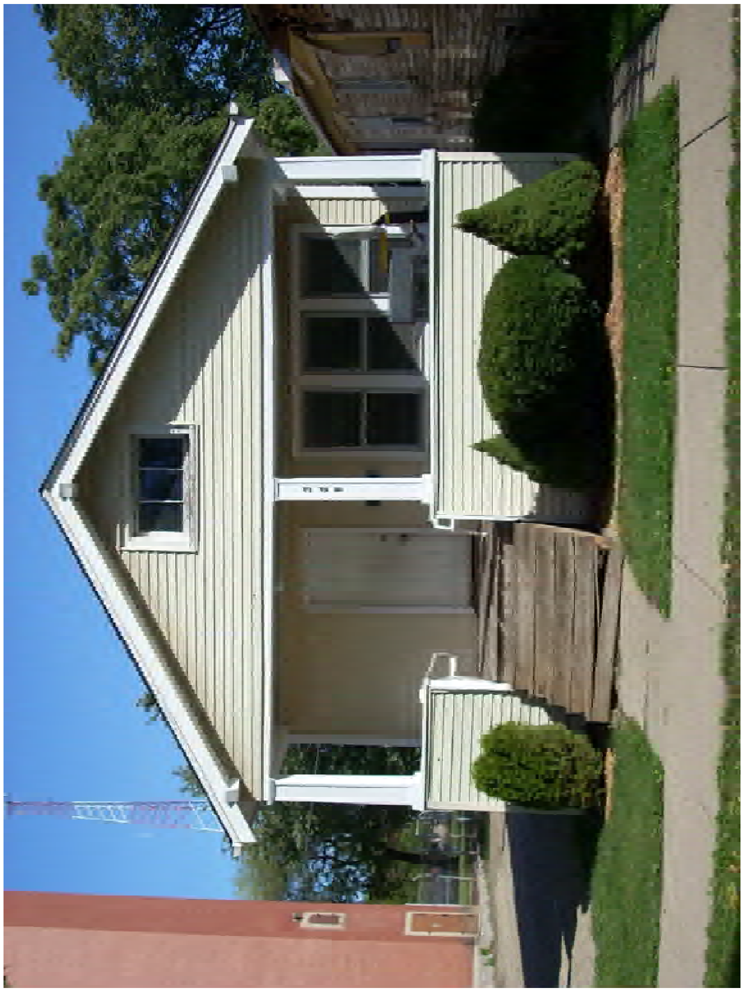
South façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman bungalow in the Roseland community is situated on a raised concrete block basement with glass block windows. The residence is clad with synthetic siding, has a hip roof covered with asphalt shingles, overhanging eaves, and a gable dormer with three original wood casement windows. The front elevation features a strip of four one-over-one wood-sash windows and a recessed corner porch with a hollow core metal door, an adjacent casement window, wood steps, metal railings, and a corner support consisting of a low faux stone pier topped by a short open metal post. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

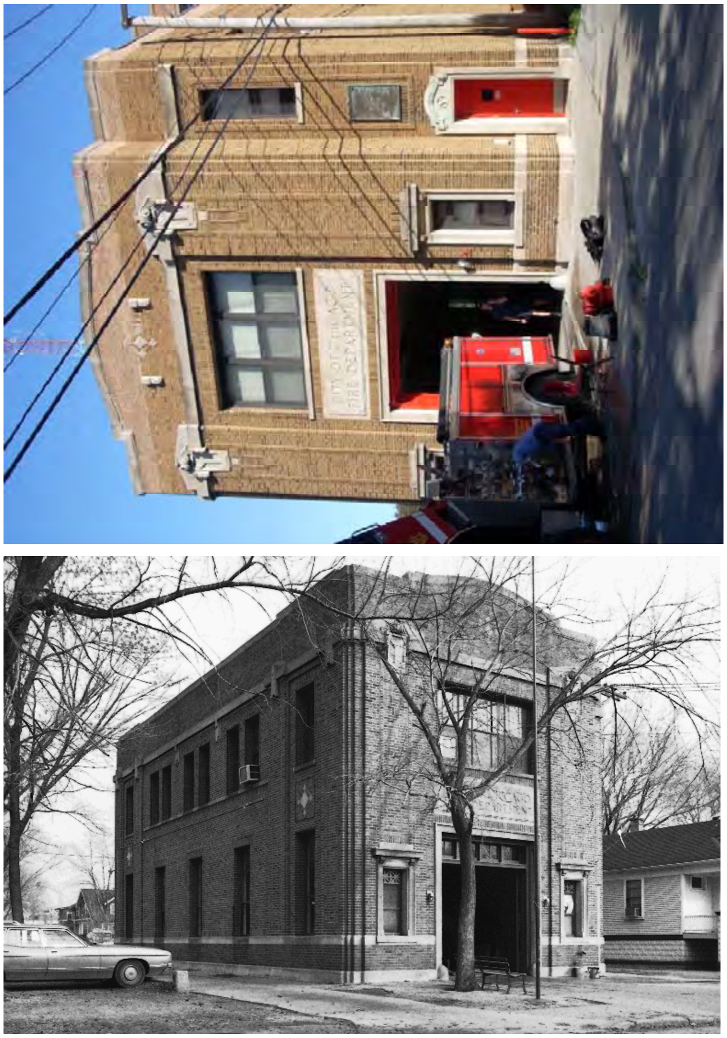
South façade of a brick, two-story, fire station (above), HAARGIS (below)



Property Description: **Stories:** 2

This two-story firehouse in the Roseland community is clad with light brown face brick and has a flat roof and a parapet with concrete coping. Its front elevation has a two-story projecting pavilion, an overhead garage door, two window openings, an off-center hollow core metal door on the first floor, and a strip of three windows and a single window on the second floor. All windows are non-original one-over-one aluminum sash. The spandrel area between the garage door and the windows above features a large stone sign plate inscribed with the words, “City of Chicago Fire Department.” The spandrel area between the corner door and window above has a metal plate identifying the 1917 construction date and the names of a series of people associated with the building’s construction, including the mayor, alderman, city architect, and contractor. Detailing includes stone door and window surrounds on the first floor, bracketed stone window lintels, concrete belt courses, and brick pilasters topped by stone panels with the City of Chicago’s “Y” motif and decorative scrolls. The “Y” motif is also situated above the off-center door. This building is

recommended as eligible for individual listing on the National Register under Criterion C for architecture. It is a rare extant example of an early twentieth-century neighborhood firehouse in Roseland, has largely retained its original building materials and detailing, and still functions as a firehouse.

Photos with Captions:
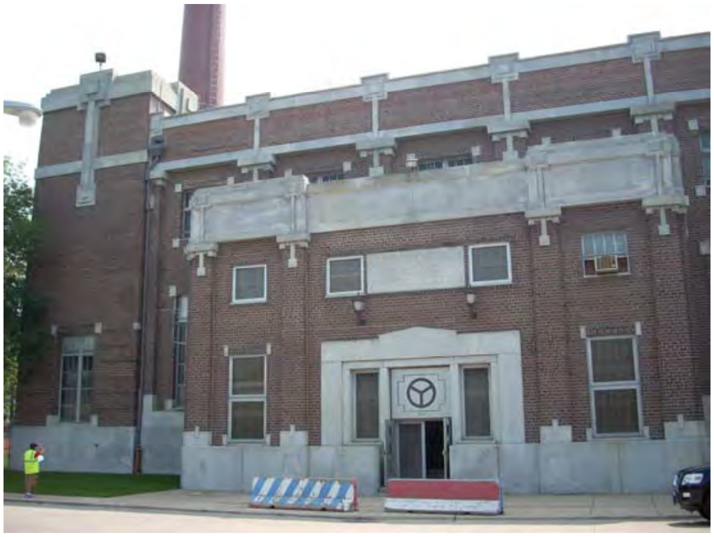
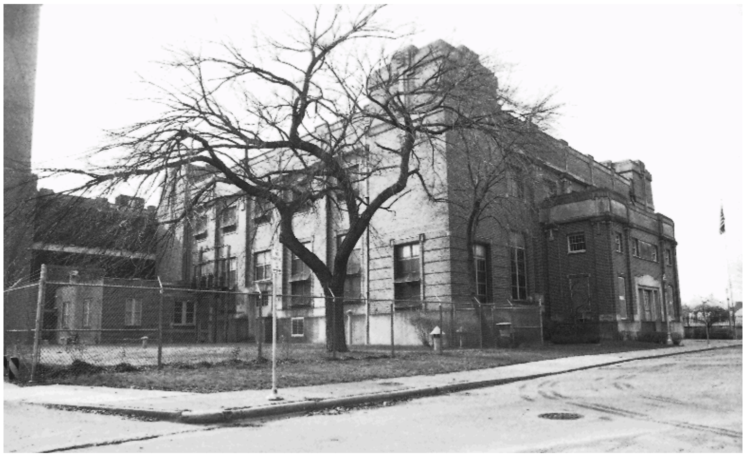
North façade of brick pumping station (above), north and east facades of pumping station from HAARGIS (below).





Property Description: **Stories:** 2

The two-story Prairie style Roseland Pumping Station is clad in brown brick. It has a high limestone watertable, a flat roof, parapet, and two square towers at the corners of the front (Roseland) elevation. The front elevation features a projecting, two-story flat-roofed entrance pavilion with a pair of centrally located glass double-doors, sidelights, and a stone panel above that features the City of Chicago’s “Y” emblem in metal. The entrance has a smooth stone surround. Above the entrance is a limestone panel incised with the words: “City of Chicago Roseland Pumping Station.” Detailing on the entrance pavilion includes brick pilasters with stone bases, coping, and geometric motifs. The parapet is clad in limestone and features decorative geometric motifs. The building’s fenestration is largely comprised of multi-paned steel sash windows, some of which have transoms.

This is an excellent intact example of a community pumping station with fine integrity that still functions in its original use. It is recommended as individually eligible for the National Register under Criterion C for architecture as a well-preserved example of a community pumping station designed in the Prairie style.

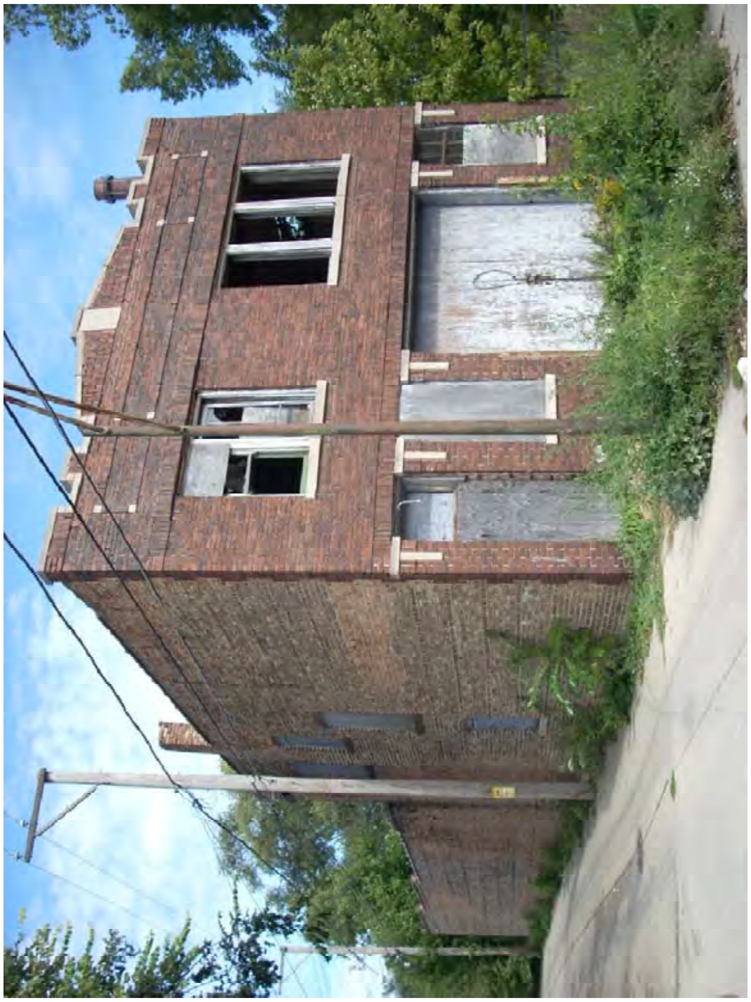
South façade of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story building in the Roseland community, a former warehouse later converted to residential use and now abandoned, has a flat roof and shaped parapet with concrete coping. Its front elevation is clad in brown face brick and its side and rear elevations are clad with common brick. The front elevation has an off-center door opening with transom, a garage door opening, and two window openings, all of which are covered with plywood. A portion of one of these window openings is visible and reveals a multi-paned upper sash. The second floor has a pair of window openings and a strip of three window openings, all of which have had their glass panes removed. Detailing includes concrete sills and insert blocks between the first floor openings, two brick soldier courses, and brick stringcourses at the parapet level. This building does not have sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

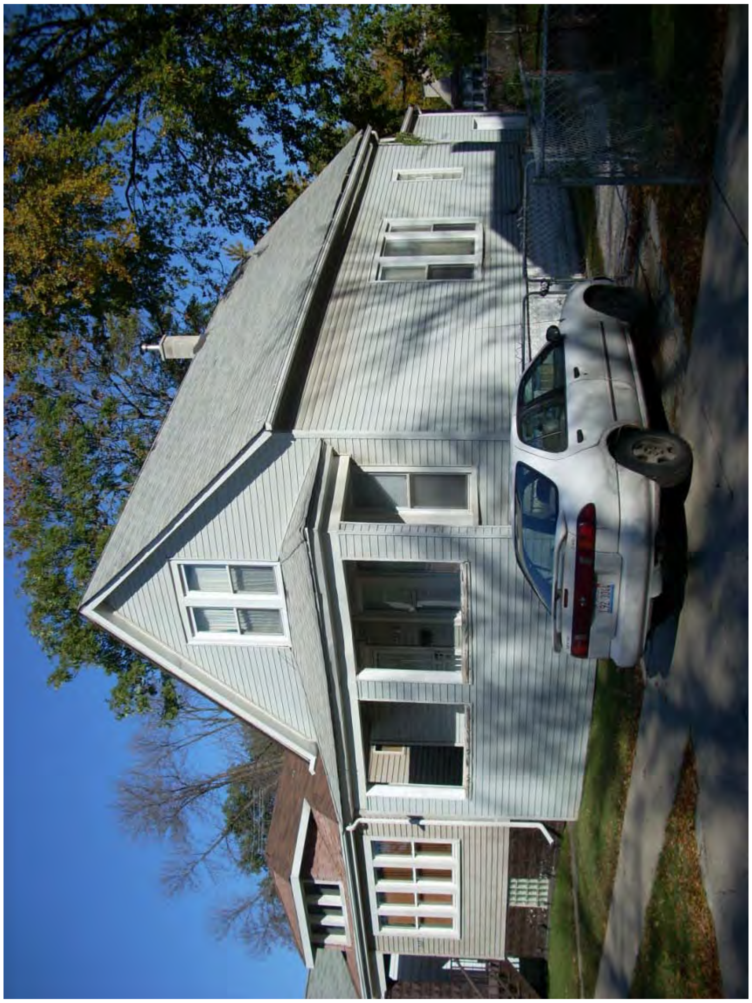
South and east façades of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. The front elevation has a full-width, hip-roof, wood porch with low, synthetic-clad walls, boxed supports, and side-facing steps. The residence also has an off-center metal storm door, a three-sided bay window on the first floor, and paired windows in the gable, all of which feature non-original one-over-one aluminum sashes. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

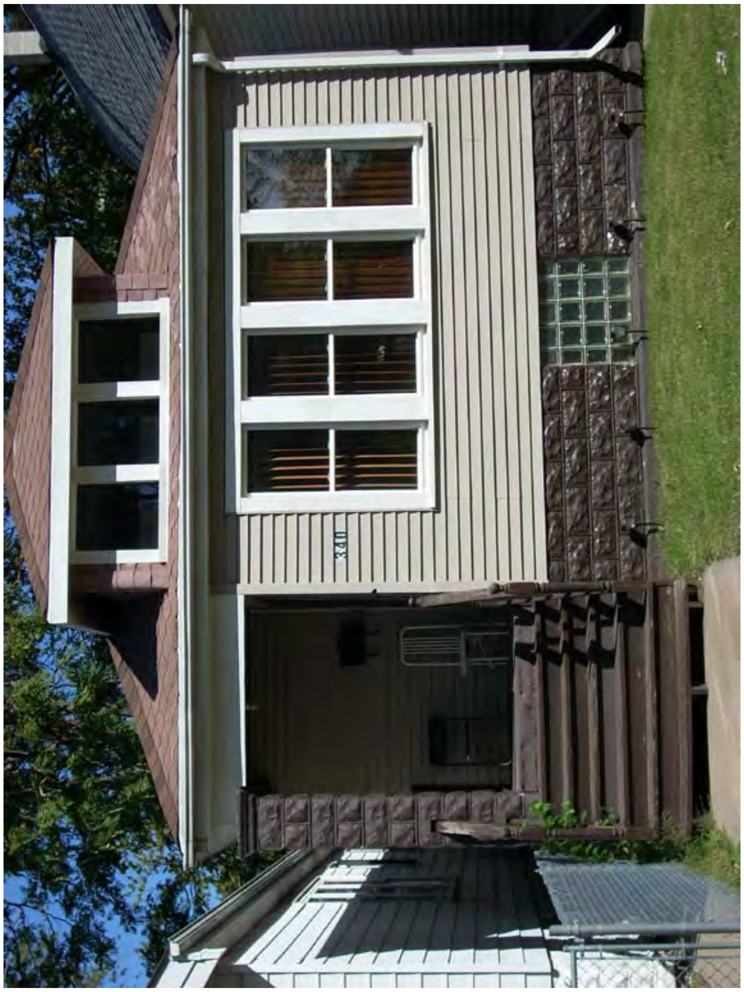
South façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story, Craftsman style, frame bungalow in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a hip roof covered with asphalt shingles, overhanging eaves, and a hip dormer with three casement windows. The front elevation has a recessed corner porch with a concrete block corner pier, a front door tucked into the north side of the living room bay, wood steps with wood railings, and a strip of non-original one-over-one aluminum-sash windows. This is an example of a frame Craftsman bungalow, a residential building type that was produced during the 1910s and 1920s. This house does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

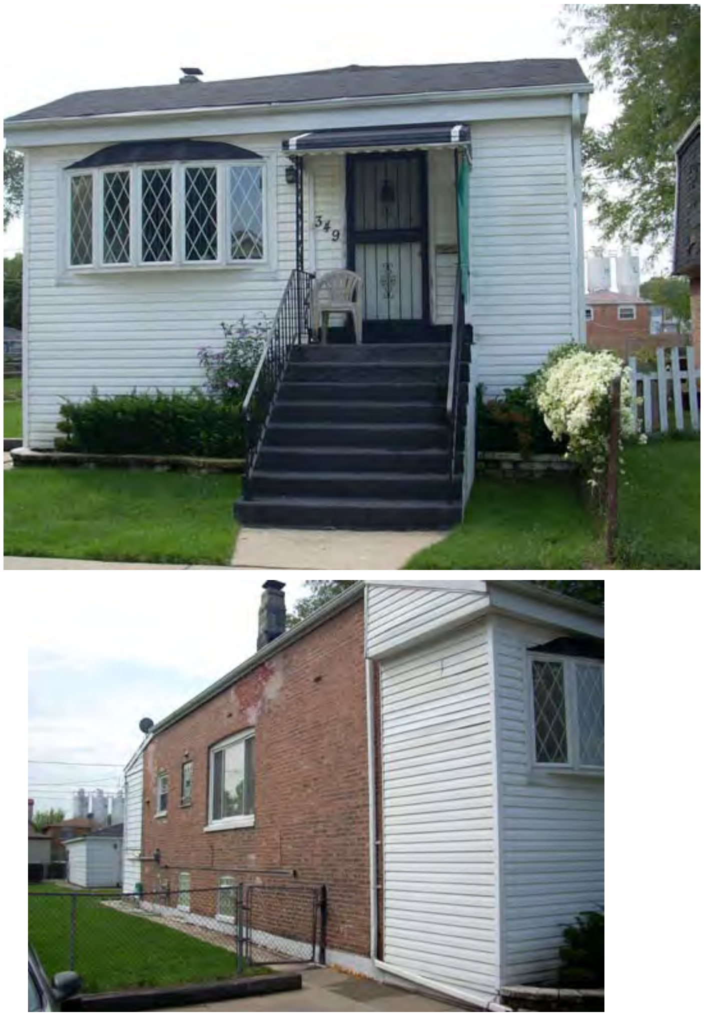
North façade of a brick and vinyl, one-story, single family residence.



Property Description: **Stories:** 1

This building consists of a central, hipped-roof, brick clad structure on a raised basement that was constructed in 1914. Later, shed-roof, vinyl clad additions were constructed on the front and rear of the central brick portion. The front elevation features an off-center porch with concrete steps, metal railings and supports topped by a metal awning roof. It also has a hollow metal front door and a five-sided bow window. This home lacks both integrity and architectural distinction and is not individually eligible for listing on the National Register.

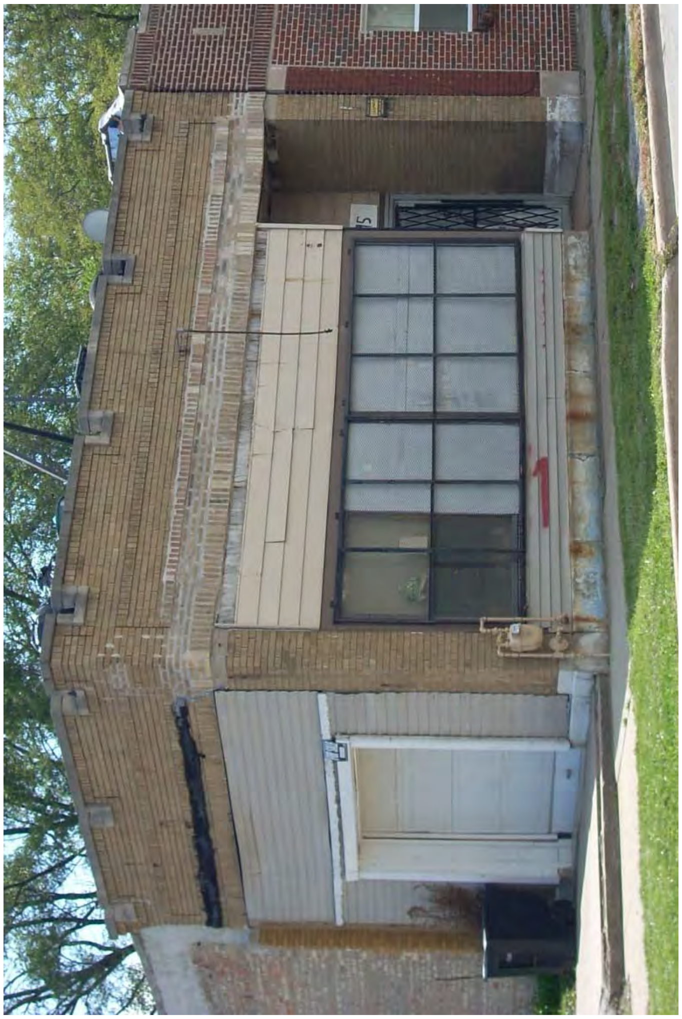
North and east façades of a brick, one story, commercial building.



Property Description: **Stories:** 1

This one-story commercial building in the Roseland community has a flat roof, castellated parapet, a brick panel at the cornice line, and concrete coping. Its front elevation is clad in yellow face brick and has a recessed, off-center hollow core metal door that is non-original. Aluminum siding has replaced this door’s original transom and its original storefront has been in-filled with a strip of fixed pane windows with aluminum siding above and below. The north portion of its east elevation is also clad in yellow face brick and has been altered with the insertion of an overhead metal door that is surrounded by aluminum siding. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

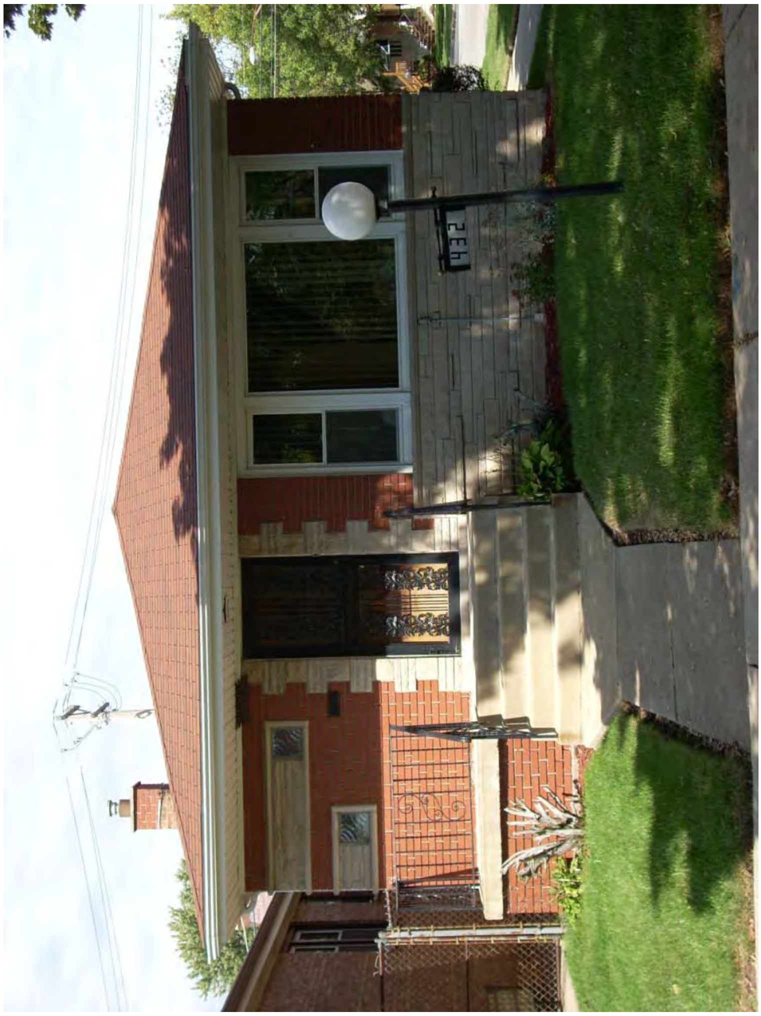
South façade of a masonry, one-story, single family residence.



Property Description: **Stories:** 1

This one-story home at the northwest corner of 107th Street and Eggleston Avenue in the Roseland community is situated on a raised brick basement. The building has a hip roof covered with asphalt shingles and overhanging eaves. The front elevation is clad with faux stone below the sill line and red brick above. The building has an off-center door behind a metal storm, concrete steps with metal railings, and a picture window flanked by one-over-one aluminum-sash windows. Detailing includes faux stone blocks flanking the front door and two horizontal strips of faux stone, each with a glass block, on the front elevation. The side (Eggleston) elevation is clad in red brick and has two pairs of four-over-one windows. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

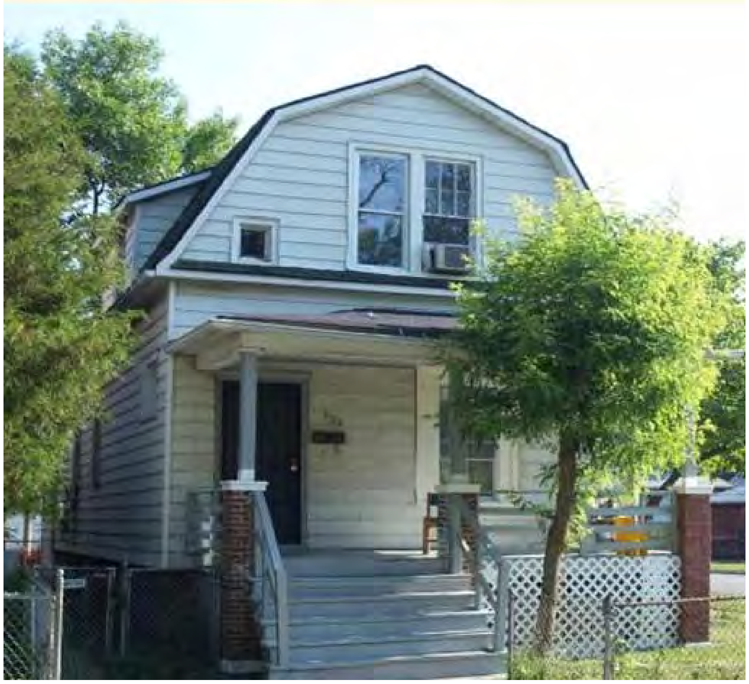
South façade of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This 1.5-story house at the northwest corner of 108th Street and Princeton Avenue in the Roseland community is situated on a raised brick basement and is clad with synthetic siding. The building has a gambrel roof covered with asphalt shingles. Its front (108th Street) elevation has a full-width, hip-roofed, wood porch with frieze band and supports consisting of three brick piers topped by squat wood posts. The building has an off-center door and a single double-hung window on the first floor. A pair of double-hung windows and a small casement window provide light to the attic space. Its Princeton Avenue elevation has a three-sided window bay. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

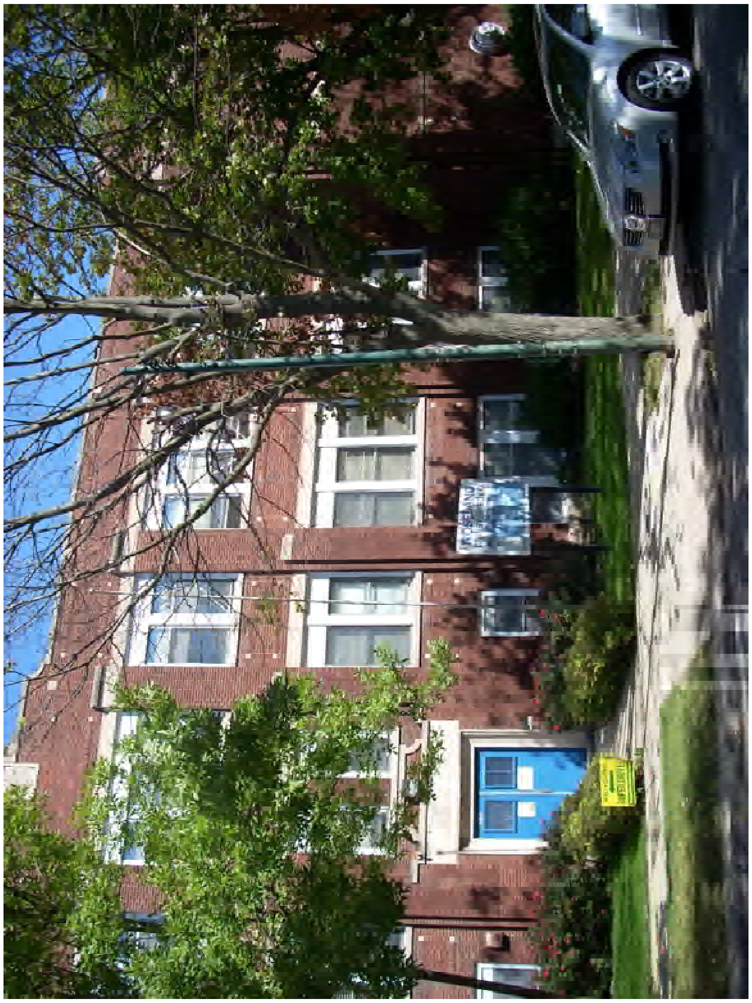
South façade of a brick, three-story school.



Property Description: **Stories:** 3

This three-story school in the Roseland community is clad in brown face brick. The building has a flat roof, shaped parapet with concrete coping, and corner pavilions. Full height brick pilasters divide the front elevation into a series of bays, each of which contains a strip of three one-over-one windows. The main entrance features a pair of non-original hollow core metal doors topped by a stone sign plate inscribed with the words, “Roseland Christian School.” Detailing includes decorative brick panels in the spandrels, concrete sills and lintels. This school lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

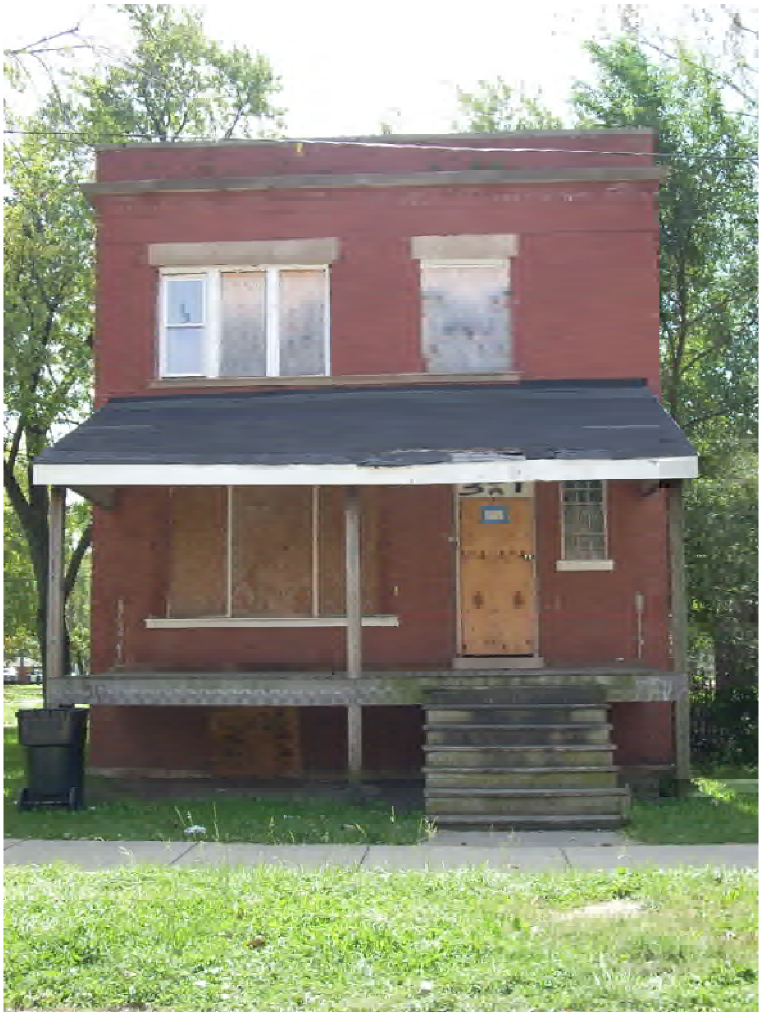
North façade of a brick, two-story, multi-family residence.



Property Description: **Stories:** 2

This two-flat residential building in the Roseland community is situated on a raised basement and is clad in red brick. The building has a flat roof and parapet. The front elevation has a full-width shed-roofed porch with wood posts and steps but no railings, an off-center door, an adjacent glass block window, and a group of three windows on the first floor. The second floor of the front elevation has a group of three windows and a single window. Nearly all windows are covered with plywood, with the exception of two non-original one-over-one aluminum-sash windows. The east elevation has a full-height window bay pavilion. Detailing includes stone sills, lintels, coping, and cornice. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

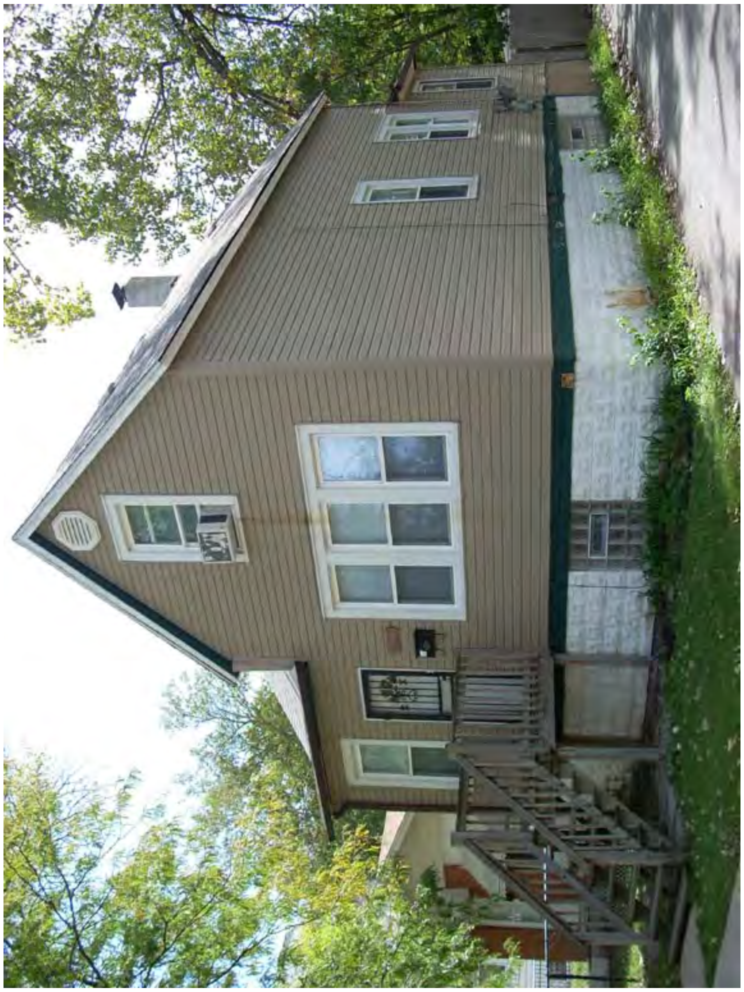
North façade of a 1.5- story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a cross-gable roof covered with asphalt shingles. The front elevation has an off-center door behind a metal storm door, non-original wood steps and railings, and five non-original one-over-one aluminum-sash windows: four on the first floor and one in the gable. Review of the 1938 Sanborn and the assessor’s 2007 photograph suggests that while the front and rear porches are original to the house, a second story was added to the residence between 1938 and 2007. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one story home in the Roseland community is clad with synthetic siding, has has a front-gabled roof covered with asphalt shingles, and rests on a concrete block foundation. Its front elevation features an off-center door and porch with concrete steps, metal railings and supports, and metal awning roof. It has a strip of three one-over-one windows on the first floor and a small single-pane window in the gable. Glass blocks with a central casement infill the basement window openings. This home lacks integrity and architectural distinction and is not individually eligible for listing on the National Register.

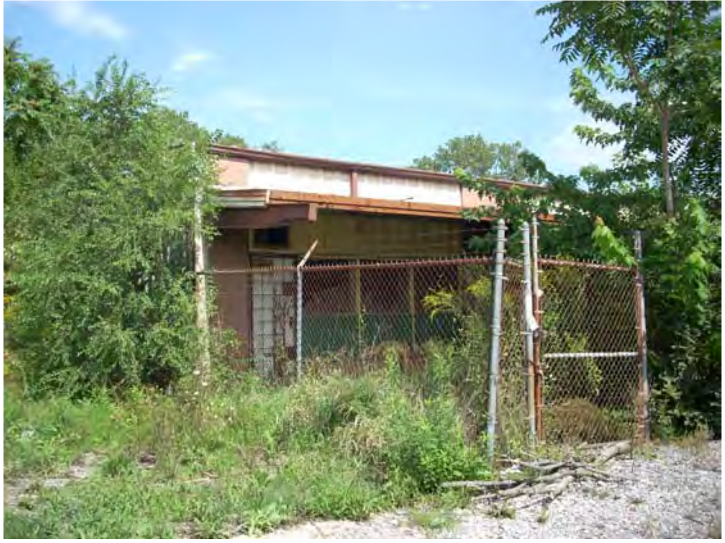
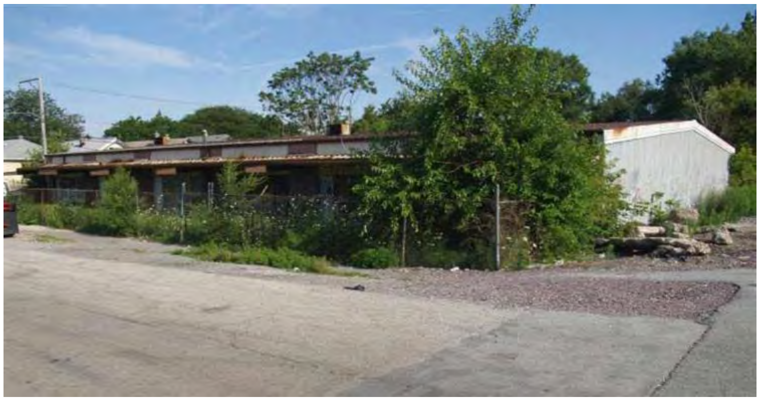
East façade of industrial, brick and metal storage shed.



South and east façades of industrial, brick and metal storage shed.



Property Description: **Stories:** 1

This one-story, side-gabled, metal shed on the vacated South Shore Iron Works property is partially obscured by foliage. The front elevation is clad in buff brick and contains a series of hollow metal doors, each flanked by three windows to one side; many are covered with plywood. A full width metal canopy is present on the front façade. The gable ends and rear elevation are clad in corrugated sheet metal. This building lacks architectural distinction and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This property includes a two story, flat-roofed concrete block building associated with South Shore Iron Works, manufacturers of structural steel. The building is difficult to see from the public right-of-way. The first floor has one-over-one windows below a metal awning and the second floor has glass block windows. Portion of the building has had its roof raised, creating more height for the interior workspace. The Cook County Assessor's photo shows large sliding metal doors on the warehouse façade. This structure lacks architectural distinction and is not individually eligible for listing on the National Register.

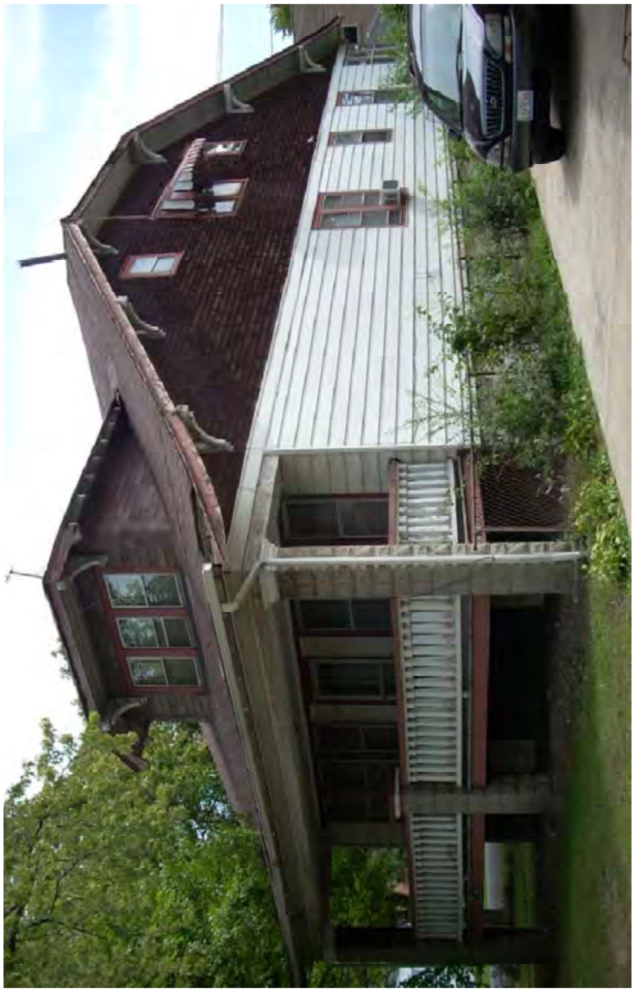
North and west façades of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman style house in the Roseland community is situated on a raised concrete block basement and is covered with synthetic siding and wood shingles. The building has a side hip-on-gable roof, overhanging eaves. There are decorative wood brackets and a hip-on-gable dormer with bracketed, overhanging eaves. There are three double-hung wood-sash windows with aluminum storms in the gable. Asphalt shingles clad the roof and the dormer. The roof has a wide overhang that serves as the roof for a full-width wood porch that has faux stone piers and wood railings, but no steps. The front elevation has a centrally located door that appears to be oak with a glass pane, which is flanked by three windows on either side, all of which are double-hung wood-sash with aluminum storms. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

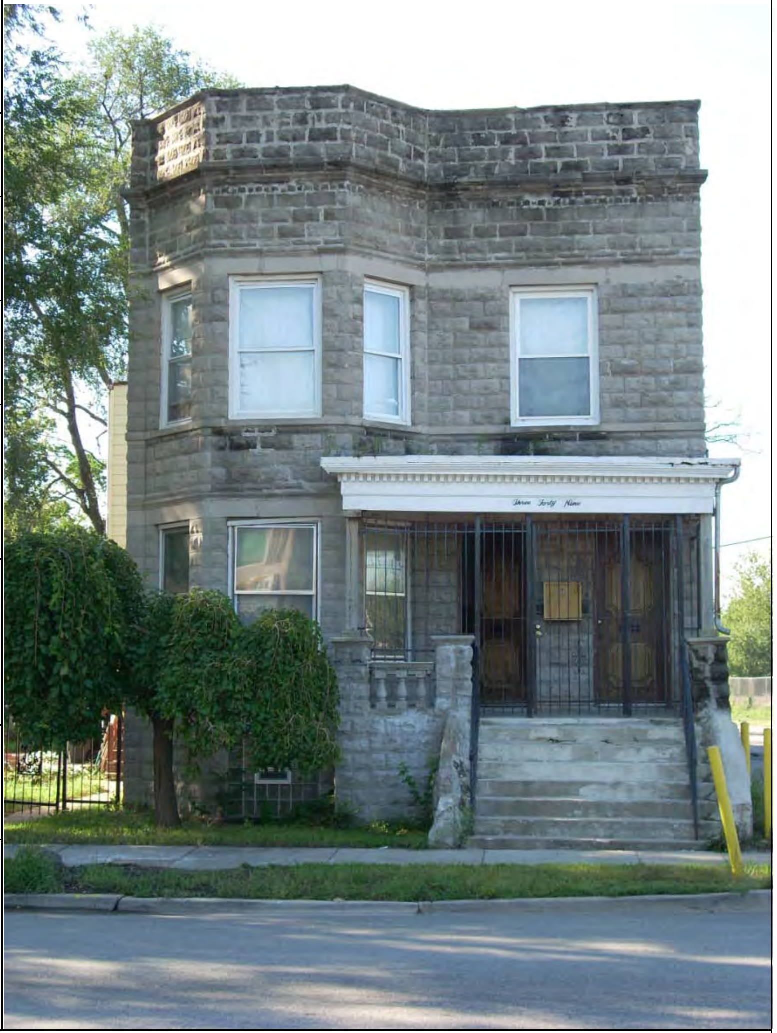
South façade of two-flat greystone residential building.



Property Description: **Stories:** 2

This two-flat greystone residential building in the Roseland community has a flat roof and parapet. Its front elevation features a full-height window bay pavilion with fenestration comprised of one-over-one replacement windows. It has an off-center porch with two entrances that feature non-original wood doors, stone steps, metal and stone railings, and wood columns supporting a flat wood roof with dentil molding. Detailing includes a stone sill courses, lintels, beltcourses, and cornice.

The City of Chicago has recognized this building type through its Historic Greystone Initiative, which promotes the preservation of Chicago’s ornate, limestone-clad homes by offering technical assistance and financial resources to property owners. Although this is an example of the greystone residential building type, it does not possess sufficient distinguishing architectural characteristics to qualify as individually eligible for listing on the National Register.

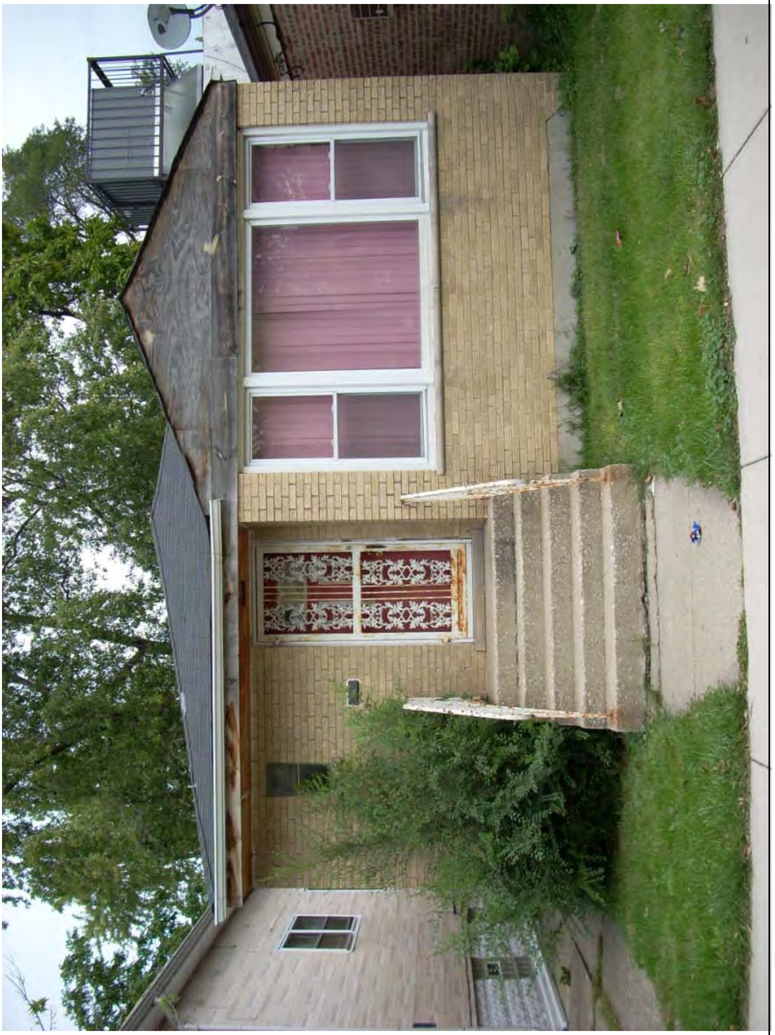
South façade of one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story house in the Roseland community is clad with buff brick on its front elevation and common brick on its side and rear elevations. The building has a raised basement and a hip roof covered with asphalt shingles. Its front elevation has a projecting three-sided living room bay with a picture window flanked by one-over-one aluminum-sash windows, an off-center entrance with a metal storm door, and concrete steps with metal railings. The gable’s cladding material has been removed. Detailing includes two decorative glass blocks adjacent to the front door. It does not display distinctive architectural features and is not individually eligible for listing on the National Register.

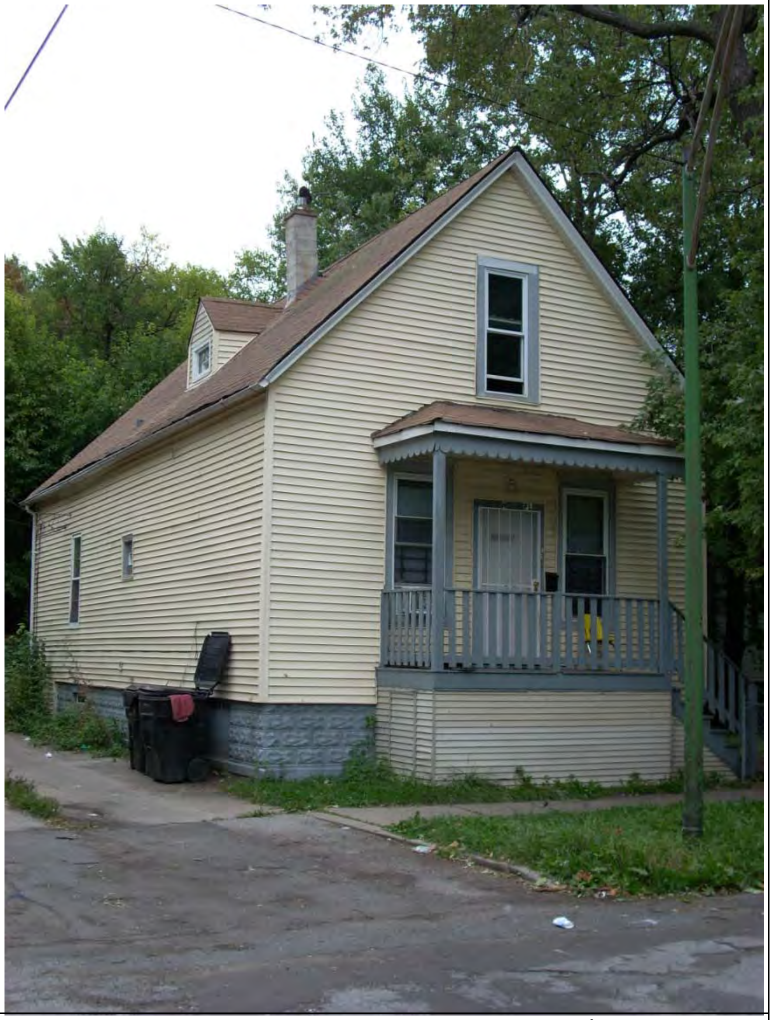
South and west façades of single-family, 1.5-story, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof with asphalt shingles and a small dormer. The front elevation has a centrally located, partial-width, hipped-roof porch with scallop detailing at the roofline, an aluminum-clad base, straight wood posts and railings (non-original), and steps on the side. It has a centrally located entrance with a metal storm door flanked by a window on either side and has a single window in the gable. Windows are non-original one-over-one aluminum-sash. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

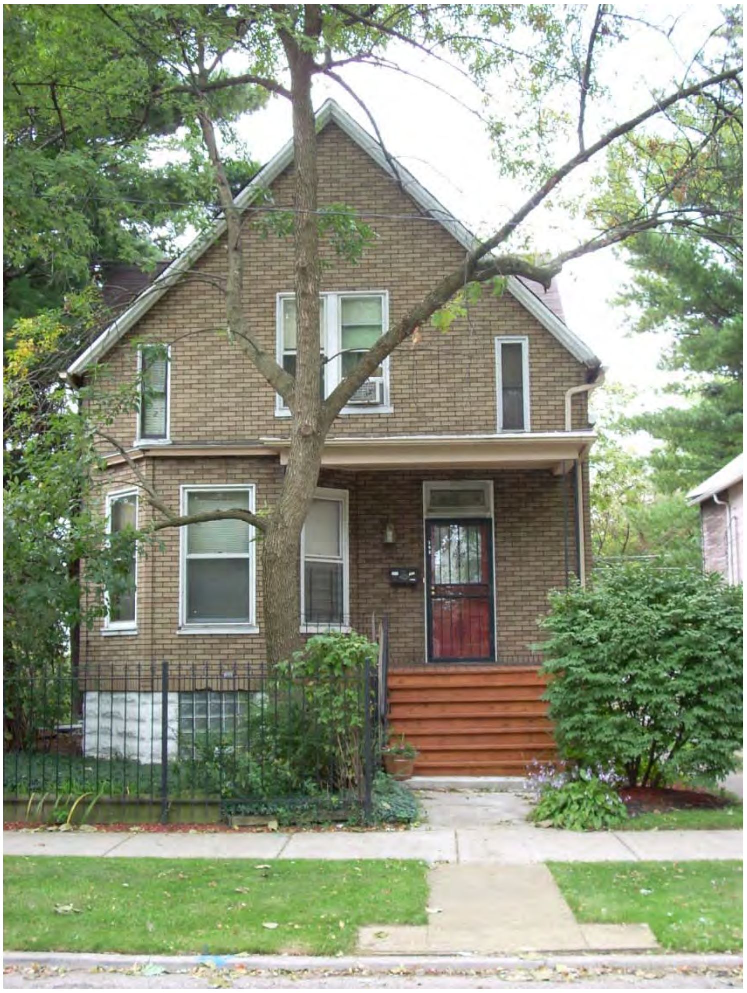
North façade of 1.5-story, single-family, brick residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house at the southwest corner of 112th Place and Princeton Avenue is situated on a raised concrete block basement with glass block windows and is clad with light brown face brick. The building has a front gable roof covered with asphalt shingles. Its front elevation has a partial-width, flat-roofed porch with wood steps and open metal railings, an off-center door with transom, and a three sided bay window on the first floor. The upper floor of the front elevation has a pair of windows and two single windows. Windows are non-original one-over-one aluminum-sash. The home’s east elevation has a three-sided, full-height window bay pavilion and its west elevation has a gable wall dormer. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the Roseland community is situated on a raised concrete block basement with casement windows. The building has original wood clapboard siding and a cross-gambrel roof with asphalt shingles. The roof extends forward to serve as the roof over the full-façade wood porch with supports consisting of faux stone piers topped by wood columns. The front elevation has an off-center wood door and a window covered with plywood on the first floor. There are two one-over-one windows on the second floor. Above the basement, windows are one-over-one, some with aluminum storms. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

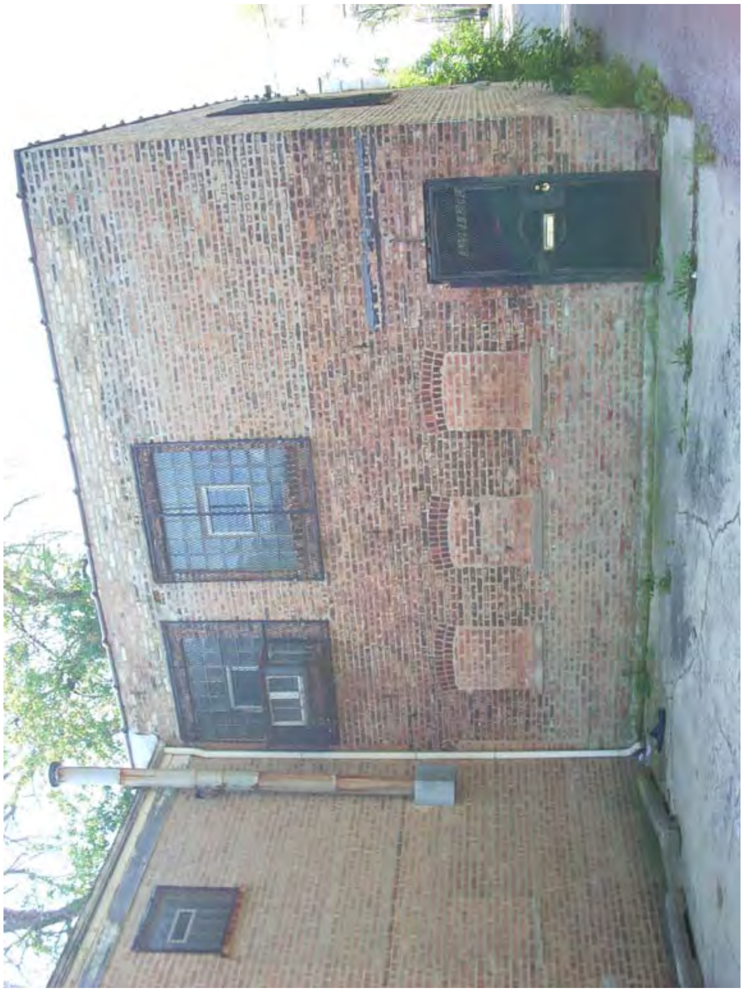
North façade of a brick, two-story industrial building.



Property Description: **Stories:** 2

This two-story, brick-clad, light industrial building in the Roseland community has a flat roof, parapet with coping, and a T-shaped footprint. The front segment of the building was a one-story building erected in 1908. Sometime after 1939, a second story and a rear wing were added. The original segment has an off-center door and the outline of three former window openings (with brick arched lintels and stone sills) that have been in-filled with brick. The second floor and the rear wing have glass block window openings with small ventilating louvers. This building lacks integrity and distinguishing architectural features; it is not individually eligible for listing on the National Register.

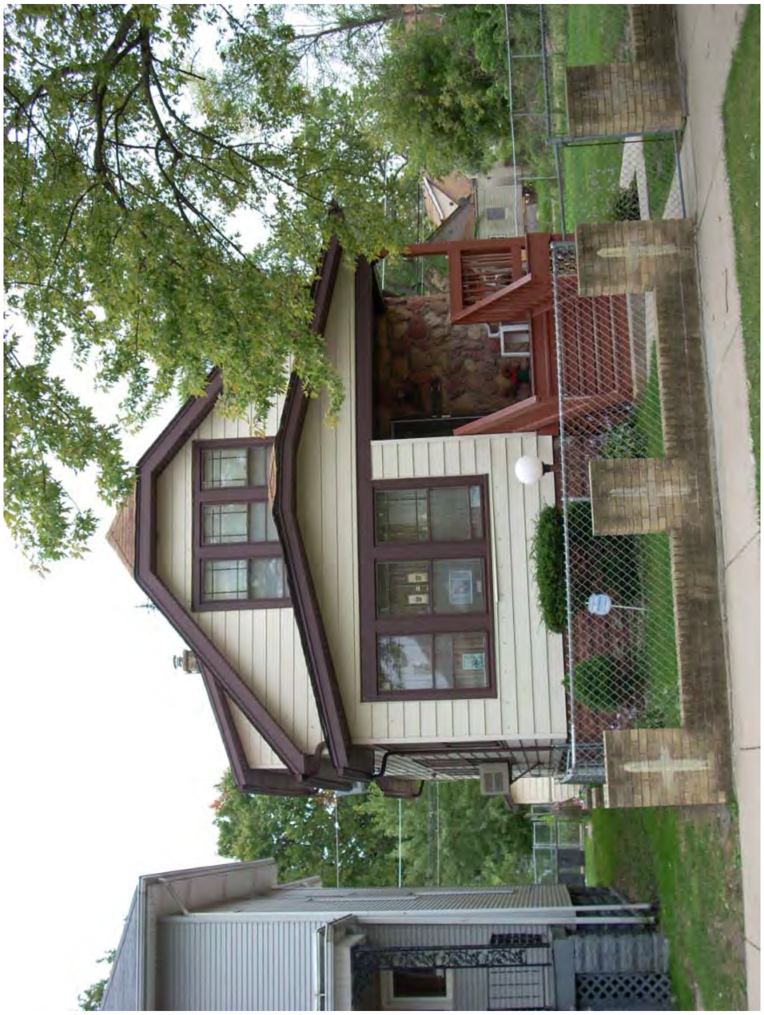
North façade of 1.5-story, single-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a hip-on-gable roof with asphalt shingles. The front elevation has a gable-roofed full-width porch, half of which is enclosed, covered with synthetic siding, and surrounded by non-original multi-paned aluminum-sash windows with some original wood-sash windows. The open corner of the porch has a wood post, wood steps and railings (non-original), and an entrance with a metal storm door that is surrounded by faux stone siding. The hip-gable area has a strip of three double-hung windows. Both side elevations have shed-roofed wall dormers. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

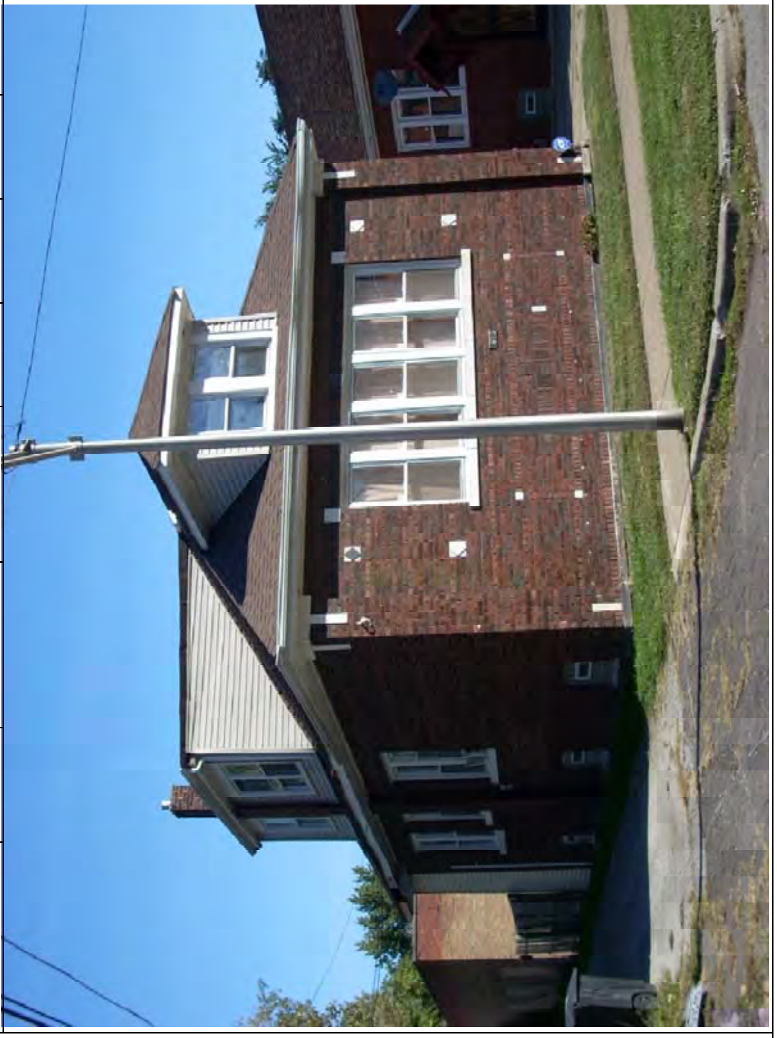
South and west façades of one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story brick bungalow in the Roseland community is situated on a raised basement with glass block windows and is clad with brown face brick. The building has a hip roof covered with asphalt shingles, a hip dormer with two windows on its front elevation, and a shed dormer with three windows on its west elevation. Both dormers are covered with synthetic siding. The front elevation has a strip of five windows. Windows throughout the house are non-original one-over-one aluminum-sash of varying sizes with the exception of a casement window along the east elevation. The main entrance is situated along the east elevation and consists of a hollow core metal door topped by a bracketed wood gabled hood. Detailing includes brick corner pilasters, concrete sills, and decorative square insert blocks. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

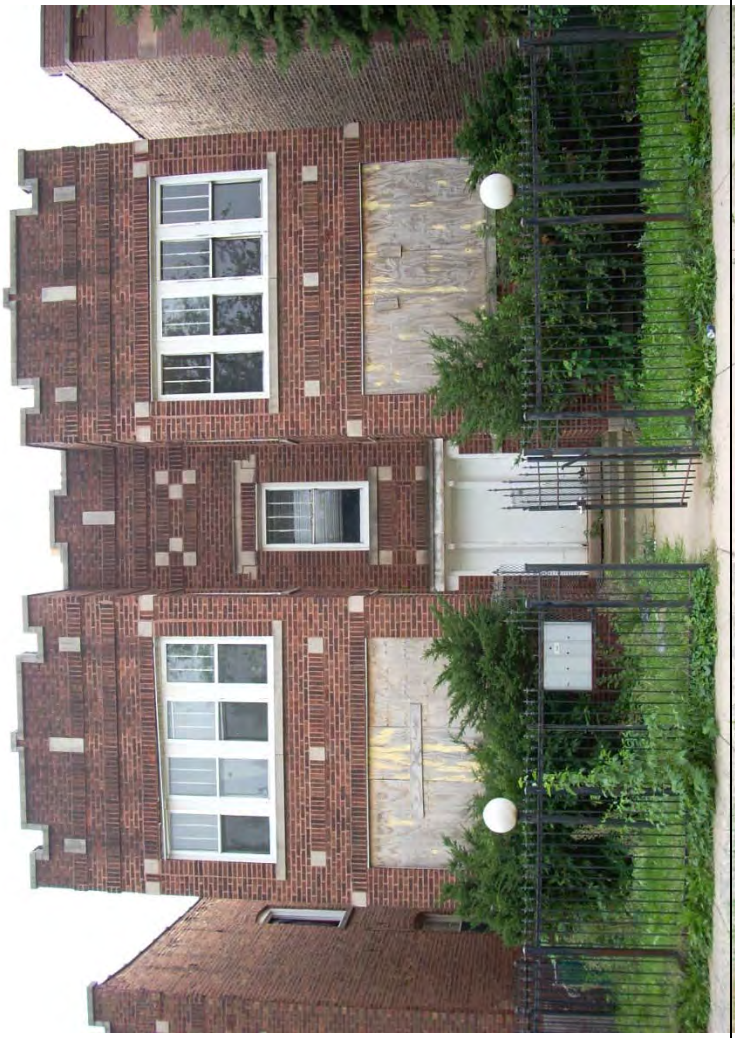
North façade of two-story, brick, four-flat residence.



Property Description: **Stories:** 2

This two-story four-flat apartment building in the Roseland community has a flat roof and castellated parapet with concrete coping. The front elevation is clad with brown face brick, has two full-height enclosed sun porch pavilions, and a centrally located entrance with sidelights that have been boarded over. The first floor windows have been covered with plywood. Second floor fenestration features two strips of three-over-one wood-sash windows. An additional three-over-one wood-sash window is situated above the entrance. Detailing includes brick soldier courses with stone coping and insert blocks. This building lacks sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Roseland community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a gambrel roof covered with asphalt shingles that overhangs the side elevations. The front elevation has a gable-roofed full-width porch, most of which is enclosed and covered with synthetic siding. Windows on all three sides of the house are covered with plywood. The off-center door is also covered with plywood and accessed via concrete steps with metal railings. There is a synthetic-clad addition on the rear elevation. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

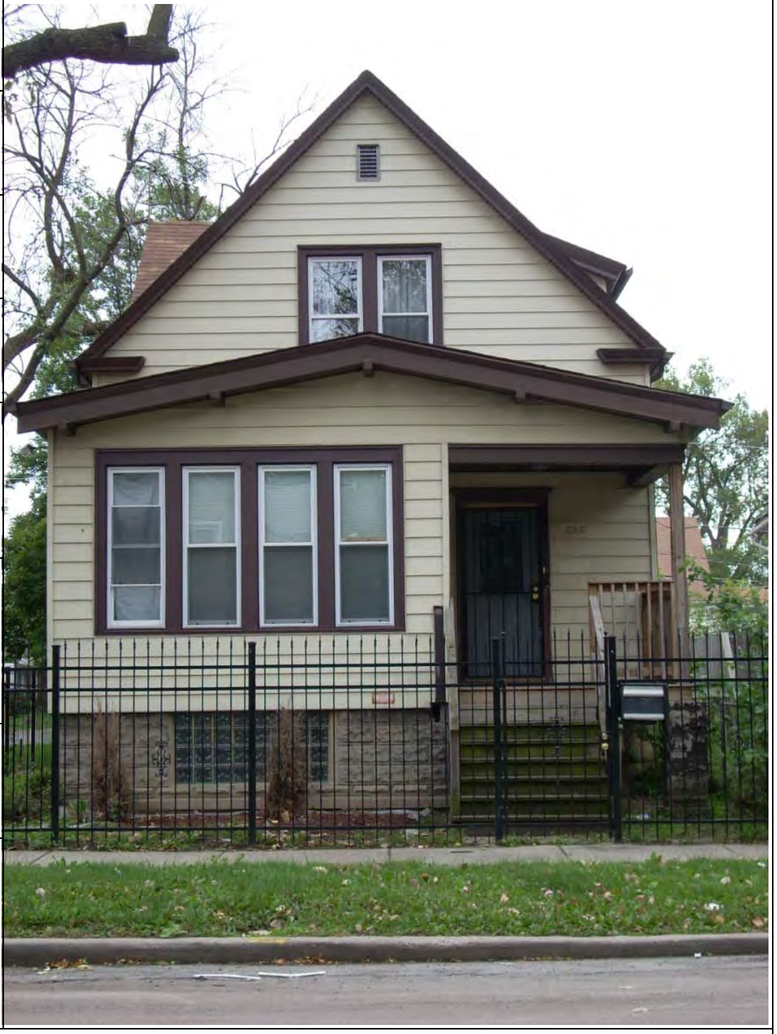
North façade of 1.5-story, single-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house at the southwest corner of 113th Street and Yale Avenue in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof with asphalt shingles. The front elevation has a gable-roofed full-width porch, most of which is enclosed with synthetic siding and surrounded on all three sides by one-over-one aluminum-sash windows. The off-center entrance with metal storm door is set within the open corner of the porch. The open part of the porch has a non-original wood support, steps and railings. A pair of windows is situated in the gable. Windows throughout the house are non-original one-over-one aluminum sash. The east elevation has a first floor window bay and both shed and gable wall dormers. The west elevation has a shed wall dormer. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

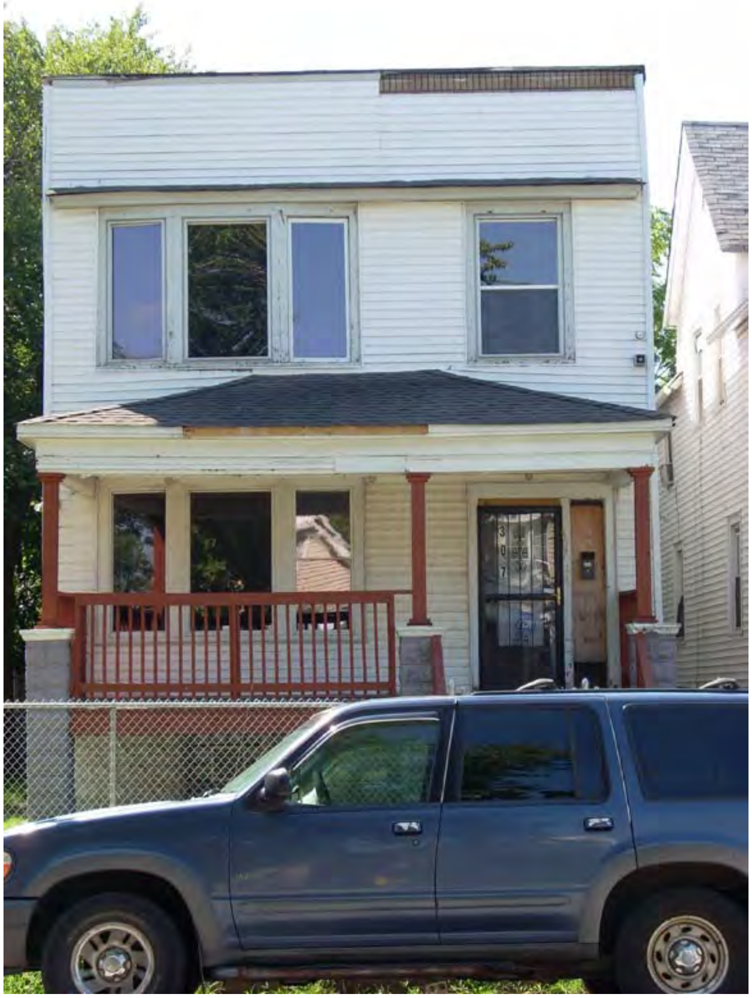
North façade a two-story, multi-family, frame residence.



Property Description: **Stories:** 2

This multi-family residential building in the Roseland community is clad with synthetic siding and has a flat roof and parapet. Its front façade has an off-center door with a sidelight in-filled with plywood. It has strips of three, non-original, single-pane windows on the first and second floors that appear to be casements and a single one-over-one window on the second floor, directly above the entrance. Doric columns support the hip roof of the porch. The wood rails and steps do not appear to be original. A plain wood cornice is situated directly above the second floor windows. This home lacks integrity and does not have sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

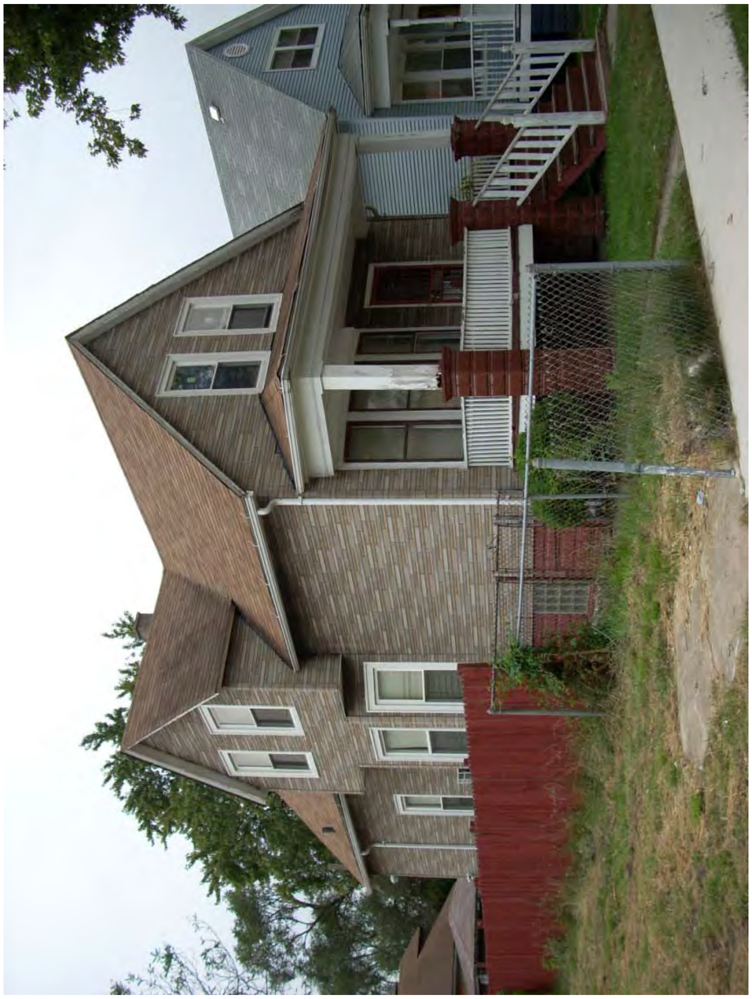
North and east façades of 1.5-story, frame, single-family residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is clad with synthetic siding. The building has a gable roof covered with asphalt shingles. The front elevation has a hip-roof, full-width porch with faux stone piers topped by squat squared wood column supports, wood steps and straight wood railings. It also has an off-center entrance with a metal storm door, a strip of three windows on the first floor, and two windows on the second. Windows throughout the house are non-original one-over-one aluminum-sash. The east elevation has a three-sided bay window on the first floor with a gable wall dormer above. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

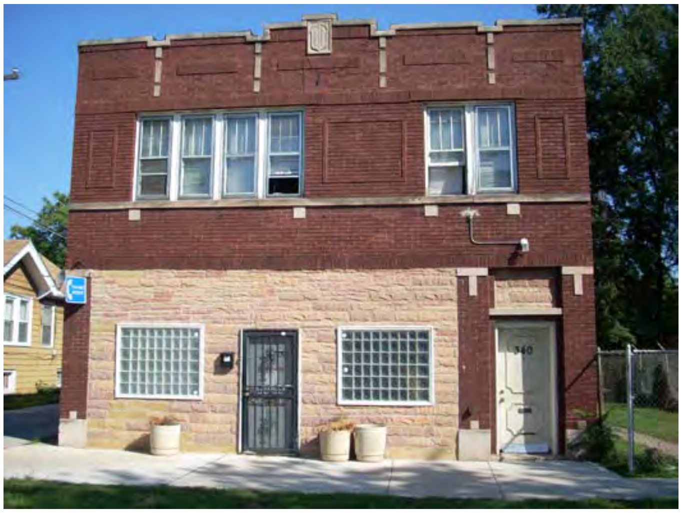
South façade of a brick, two-story, multi-family residence (above), outbuilding (garage) below.



Property Description: **Stories:** 2

This two-story residential building in the Roseland community has a flat roof and crenellated parapet with concrete coping. Its front elevation is clad in brown face brick and its side elevations are clad in common brick. The front elevation features two hollow core metal doors, the outline of a former storefront that has been in-filled with faux stone and two glass block windows, and six three-over-one wood-sash windows on the second floor. The original off-center entrance that provides access to the second floor apartment has a transom that is in-filled with faux stone. Detailing includes a concrete sill course, inset brick panels, and a parapet that features small decorative concrete insert blocks and a centrally located stone panel with shield. This building lacks integrity and does not have sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

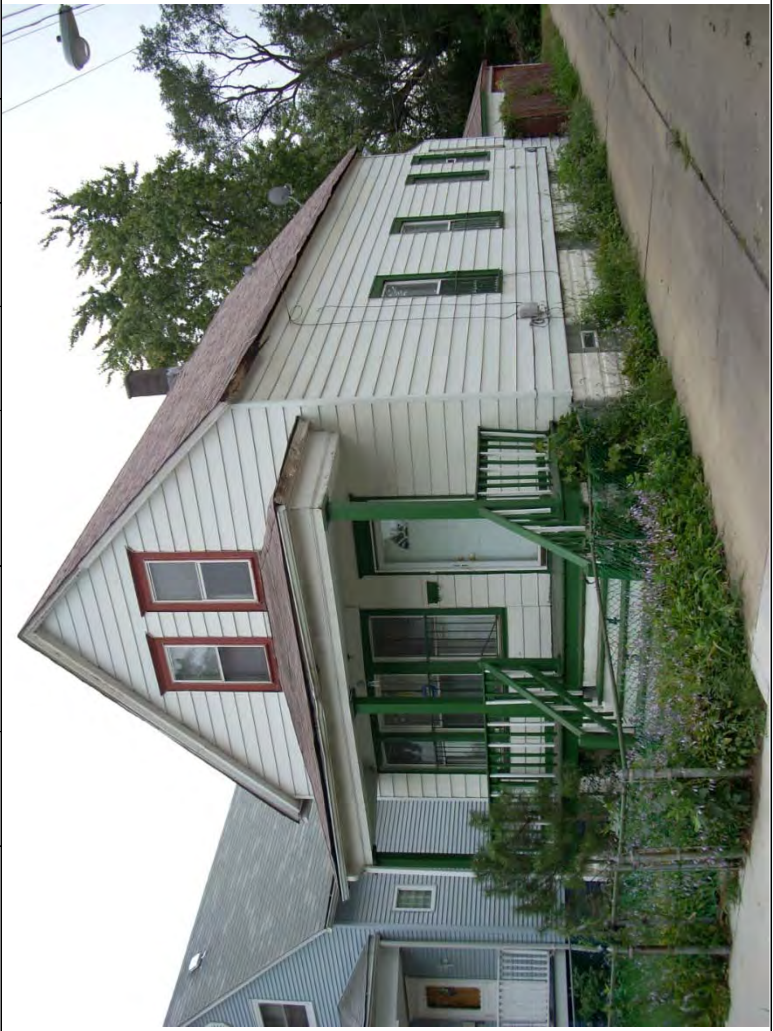
North and west façades of 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is clad with synthetic siding. The building has a front gable roof covered with asphalt shingles. The front elevation has a hip-roof full-width porch with faux stone piers beneath the wood deck, squared wood column supports, wood steps, and straight wood railings. There is an off-center non-original hollow core metal door, a strip of three windows on the first floor, and two windows on the second. Windows are non-original one-over-one aluminum-sash. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised concrete block basement, is clad in synthetic siding, and has a side gable roof covered with asphalt shingles. The peaks of the side gables are clad in wood board-and-batten. The front façade of the home has a projecting gabled entrance vestibule with a small casement window, concrete steps with metal railings, and a larger window opening that is partially obscured by a low metal awning. Non-original double-hung windows are used elsewhere. Scalloped verge boards frame the projecting gable. A rear, dormer addition is visible from the street. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

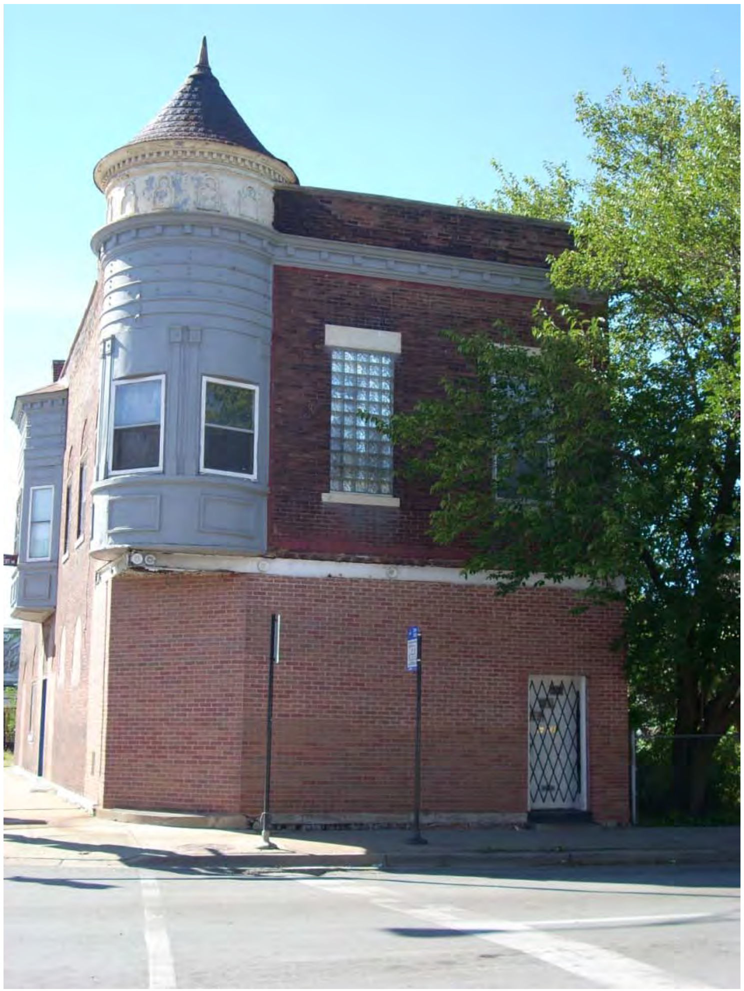
North façade of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story Queen Anne style commercial building at the southwest corner of 115th and State streets in the West Pullman community is clad with brick and has a flat roof and parapet. The first floor of both street elevations has been drastically altered by the removal of the corner storefront and the infill of virtually all door, window, and round-arch transom openings with brick. The first floor of the front (115th Street) elevation currently features a single, non-original, off-center hollow core metal door. The first floor of the State Street elevation has a centrally-located non-original hollow core metal door and a single non-original one-over-one aluminum-sash window. The second floor, however, retains its original metal corner turret with conical roof and a three-sided metal window bay on the State Street elevation. Both bays have rectangular panels at their bases and dentil molding, and the turret features decorative pilasters. However, the windows in both the bay and turret are non-original. The second floor of the 115th street elevation has a non-original glass block window and an aluminum-sash window, both of which have stone sills and lintels. The second floor of the State Street elevation has a series of non-original one-over-one aluminum-sash windows with rounded transoms that have been in-filled with brick. This building lacks integrity and is not

individually eligible for listing on the National Register.

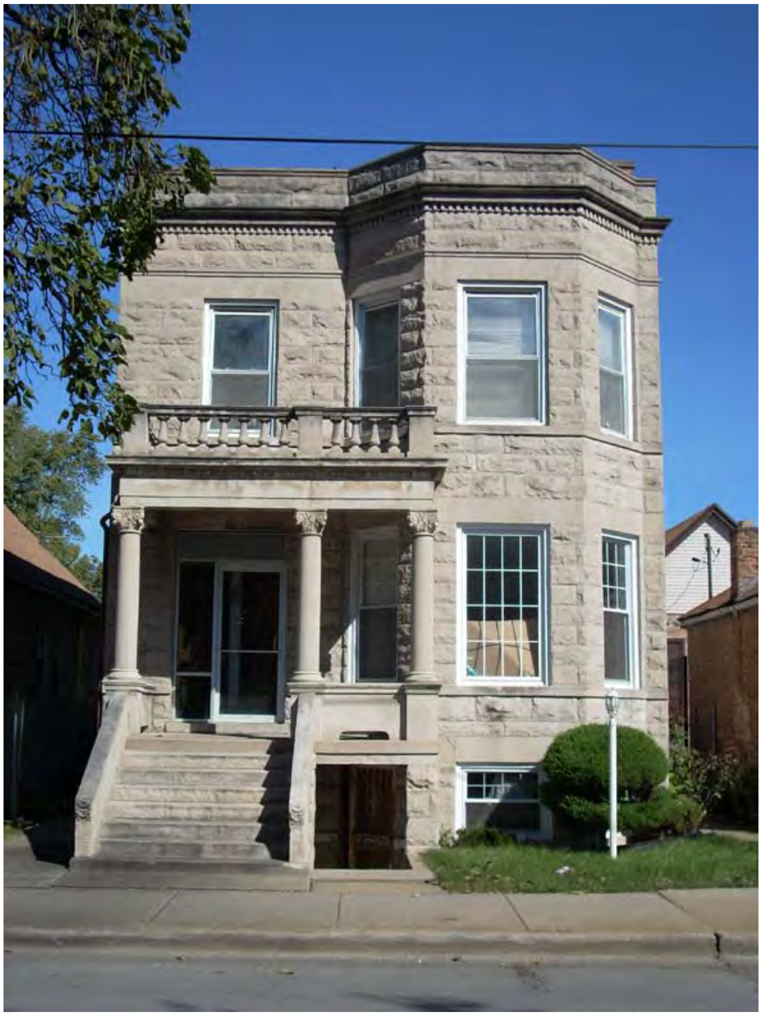
South façade of a greystone, two-flat residence.



Property Description: **Stories:** 2

This two-flat residential building in the Roseland community is situated on a raised basement and is clad with rusticated limestone on its front elevation and common brick along its side and rear elevations. The building has a flat roof and parapet. Its front elevation has a full-height three-sided window bay pavilion, a partial-width stone porch with Corinthian columns and balustrade, and an off-center entrance with metal storm door. There is a secondary entrance to the lower level. The first floor window bay has a non-original central fixed-pane window with multiple lights and flanking nine-over-one windows. The second floor of the front elevation has four non-original one-over-one aluminum-sash windows—three on the bay and one above the entrance. Casement windows provide light to the basement. Detailing includes smooth stone sill courses, belt courses, and a cornice with dentil molding.

This is an example of a greystone, a building type that the City of Chicago has recognized through its Historic Greystone Initiative. However, there are thousands of greystone residential buildings in Chicago and this particular example does not stand out among the city’s stock of this residential building type. As a result, it does not qualify as

individually eligible for listing on the National Register.

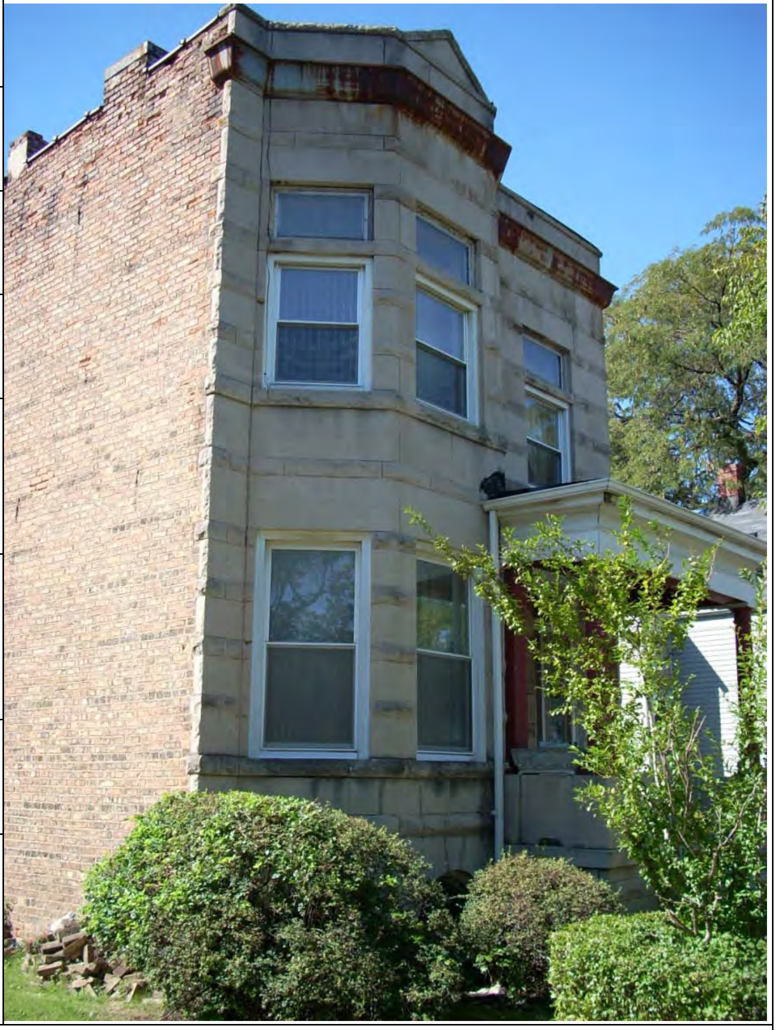
North and east façades of two-flat greystone residence.



Property Description: **Stories:** 2

This two-flat residential building in the West Pullman community is situated on a raised basement and has a front façade clad with limestone; common brick cover both the sides and rear. The building has a full-height three-sided window bay pavilion, flat roof, and a shaped parapet with a pediment above the bay. Its off-center, flat-roofed porch has concrete steps, metal railings, Doric columns, and a non-original metal door with transom. Windows are non-original one-over-one and those on the second floor feature transoms. Detailing includes continuous banding in rusticated limestone and a metal cornice.

This is an example of a greystone, a popular historic residential building type that the City of Chicago has recognized through its Historic Greystone Initiative, which offers technical assistance and financial resources to property owners to encourage their preservation. This building does not possess sufficient distinguishing architectural characteristics to qualify for individual listing on the National Register.

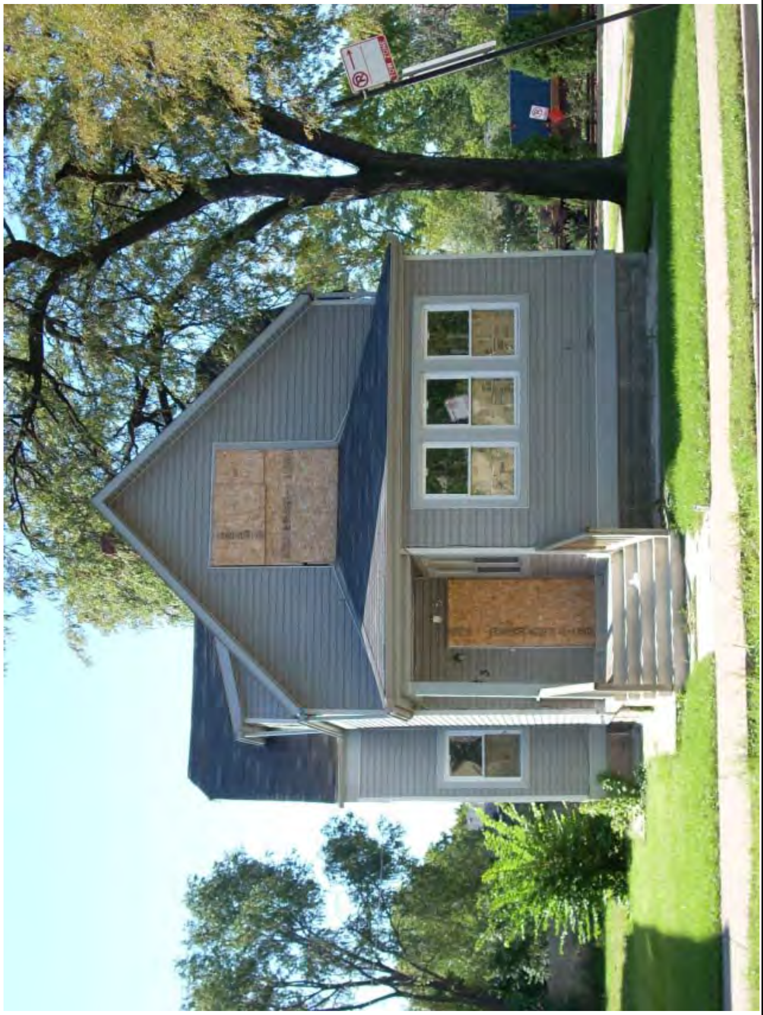
North façade of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the West Pullman community is clad with synthetic siding, has a limestone foundation, and has a gable front roof crossed by hip-on-gable sides. The front elevation has a full-width hip roof porch, a portion of which is enclosed. A shed roof dormer is visible on a side elevation. The open portion of the porch has wood steps and railings, a wood post, and a door opening covered with plywood. Windows are one-over-one aluminum-sash, some of which are covered with plywood. This house does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

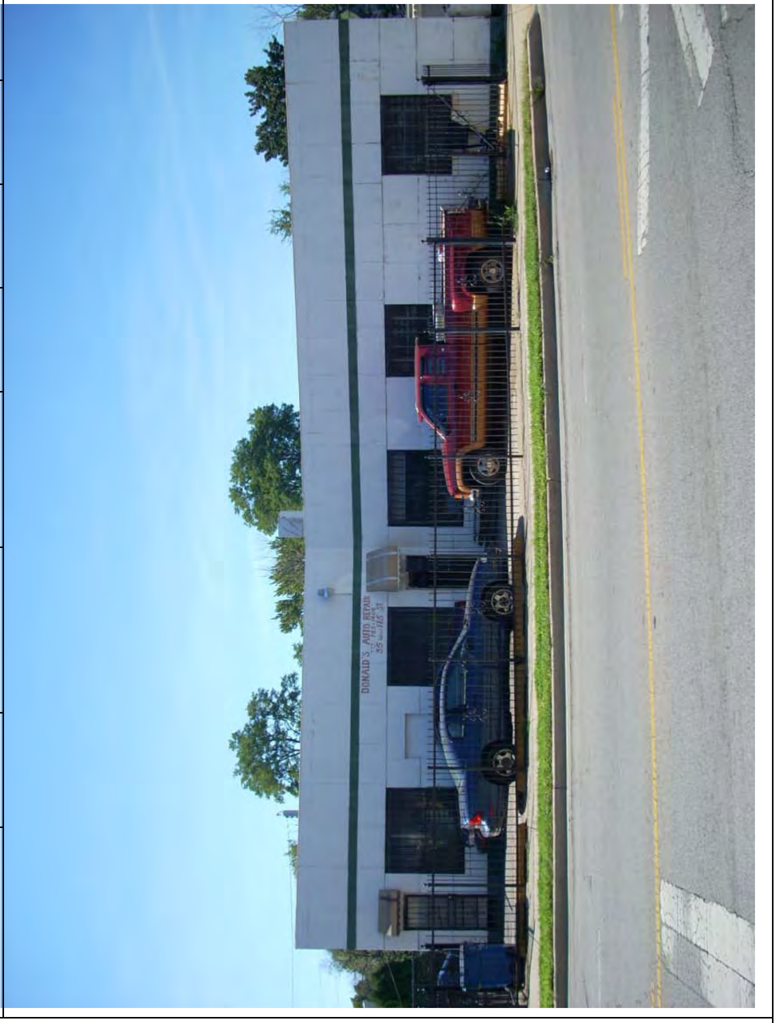
North façade of one-story, sheet metal and brick clad, commercial building.



Property Description: **Stories:** 1

This one-story auto repair building at the corner of 115th Street and Lafayette Avenue in the West Pullman community has a flat roof and a V-shaped footprint. Its street elevations are clad with white sheet metal and its rear elevations are clad in common brick. Overhead metal garage doors are situated on either end of the building while the bent front elevation along 115th Street features two metal doors and a series of fixed-pane steel sash windows. Windows along the rear of the building are covered with corrugated metal. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

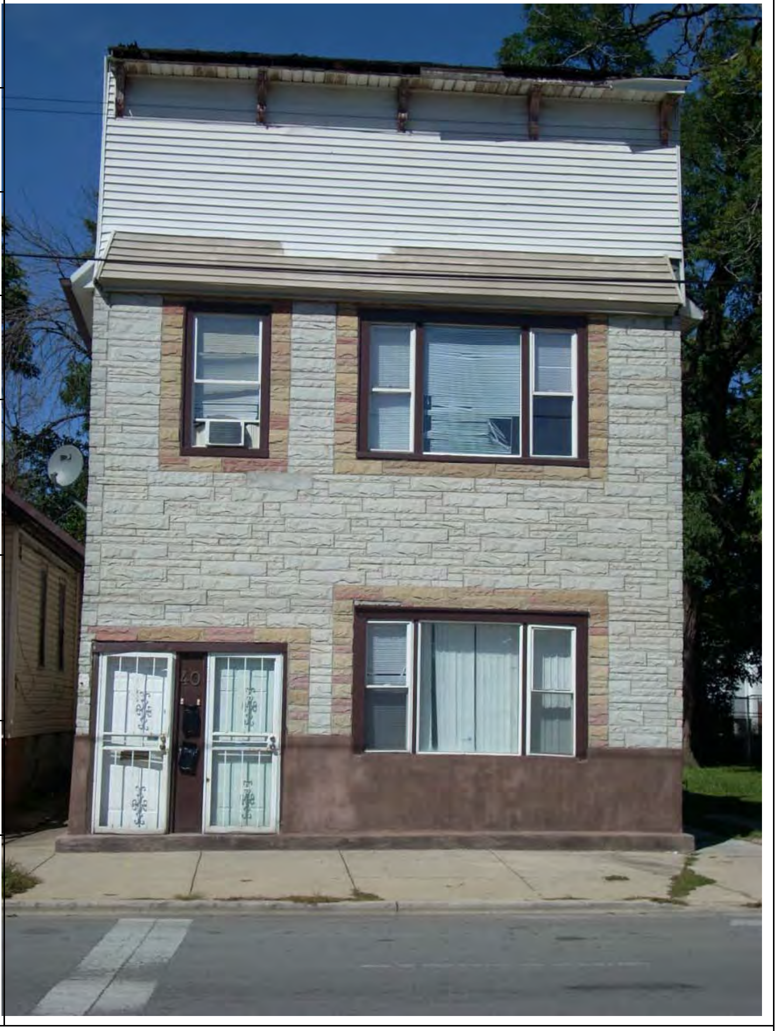
South façade of two-story, multi-family, frame residence (former commercial building).



Property Description: **Stories:** 2

This two-story residential building in the Roseland community has a flat roof and parapet. Its front façade is mostly clad in synthetic faux stone siding with contrasting colors around the doors and windows. The lowest portion of the façade is covered in stucco; the upper portion is clad in synthetic siding. The front elevation has two hollow metal core doors, Chicago-style windows on the first and second floors, and a single one-over-one window on the second floor. A pent roof is situated above the second floor windows and a bracketed wood cornice is situated at the parapet level. This building lacks integrity, does not have sufficient distinguishing architectural features, and is not individually eligible for listing on the National Register.

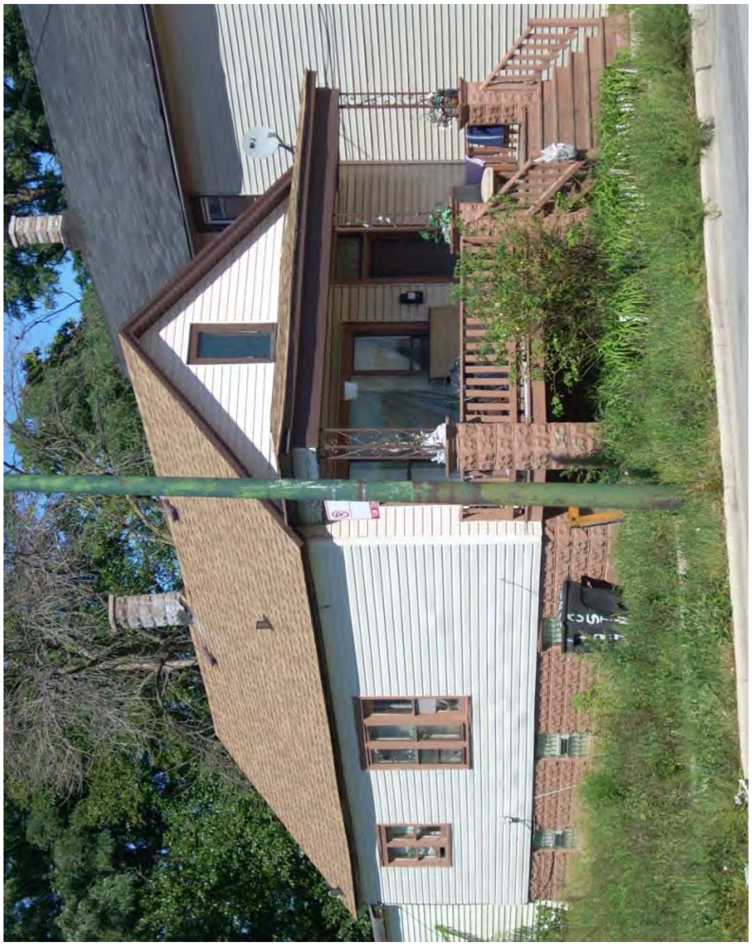
South and west façades of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised concrete block basement with glass block windows. The home is clad with synthetic siding and has a front gable roof covered with asphalt shingles. It has a full-width hip-roof wood porch with wood slat railings, and supports consisting of three concrete block piers topped by open metal posts. Its front façade has an off-center door with transom, a picture window flanked by one-over-one windows, and a single-pane window in the dormer. This home lacks integrity, does not have distinguishing architectural features, and is not individually eligible for listing on the National Register.

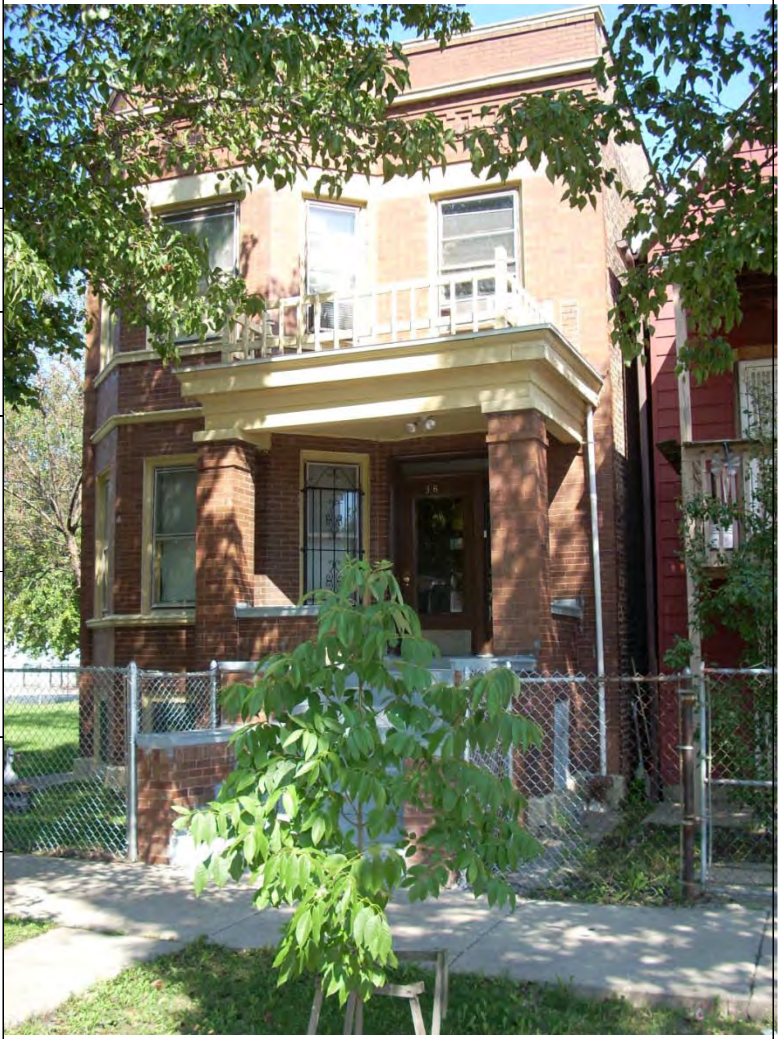
East façade of brick, two-flat residence.



Property Description:

Stories: 2

This two-flat residential building in the West Pullman community is situated on a raised basement and has a front façade clad with orange face brick. It has a full-height three-sided window bay pavilion, flat roof, and parapet. Its off-center flat-roofed porch has concrete steps, brick piers, and a single-light oak door with sidelight. Fenestration is comprised of one-over-one windows. Detailing includes stone sill courses, beltcourse, a cornice, as well as decorative brickwork on the parapet. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

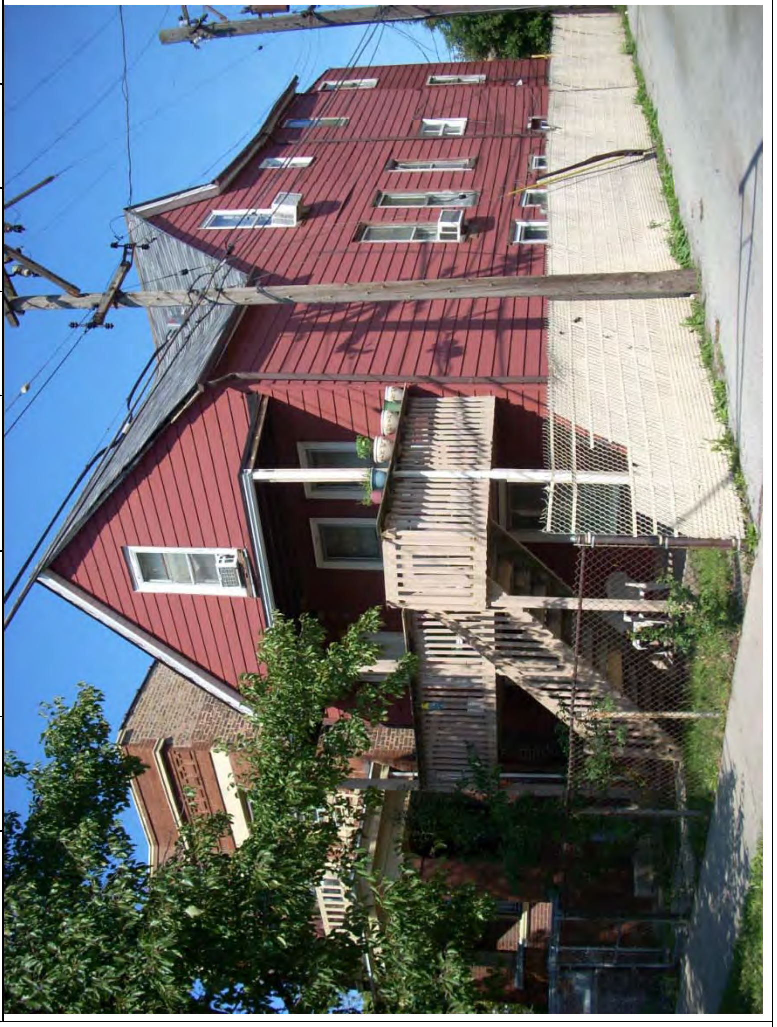
South and east façades of 2.5-story, multi-family, frame residence.



Property Description: **Stories:** 2.5

This two-and-a-half-story, multi-family house in the West Pullman community is clad with synthetic siding and has a cross gable roof covered with asphalt shingles. Its front elevation has off-center doors on the first and second floors and an elevated, flat-roofed, full-width, non-original wood porch with straight railings and posts. Fenestration on the front and side elevations is comprised of one-over-one windows. This house does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

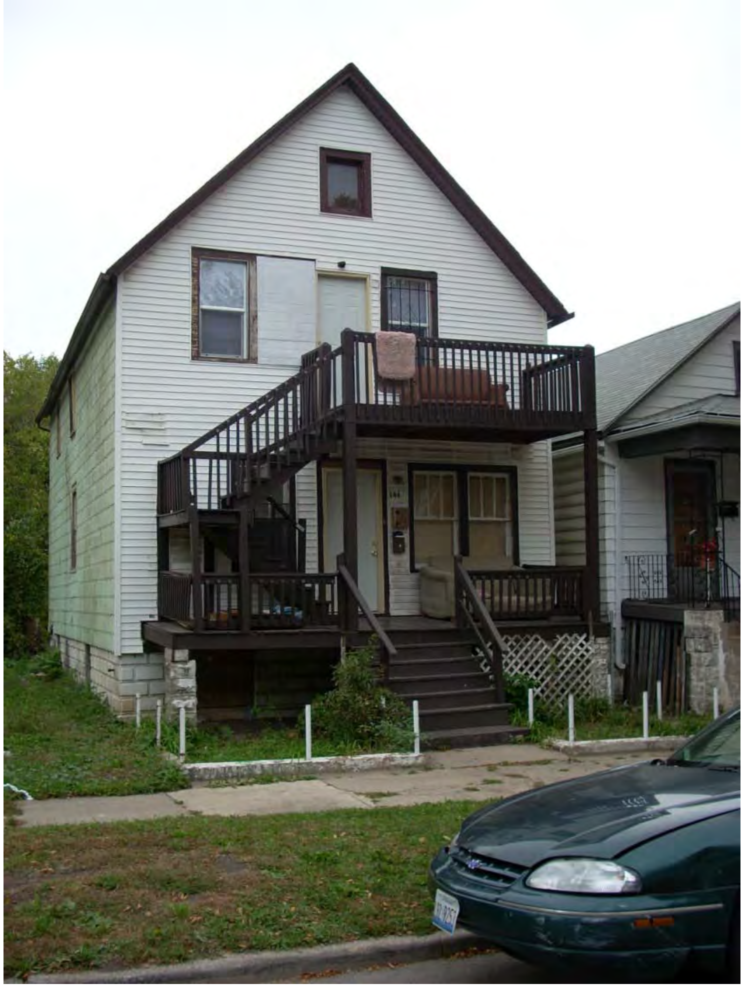
South façade of a two-story, single family, frame residence.



Property Description: **Stories:** 2

This two-story frame residential building in the West Pullman community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. Both floors of the front elevation are partially obscured by a full-width wood porch with exterior steps leading to a second floor balcony. Both floors also have a hollow core metal door and non-original double-hung windows: three on the first floor and two on the second. A third window on the second floor has been in-filled. There is a single-pane window in the gable. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

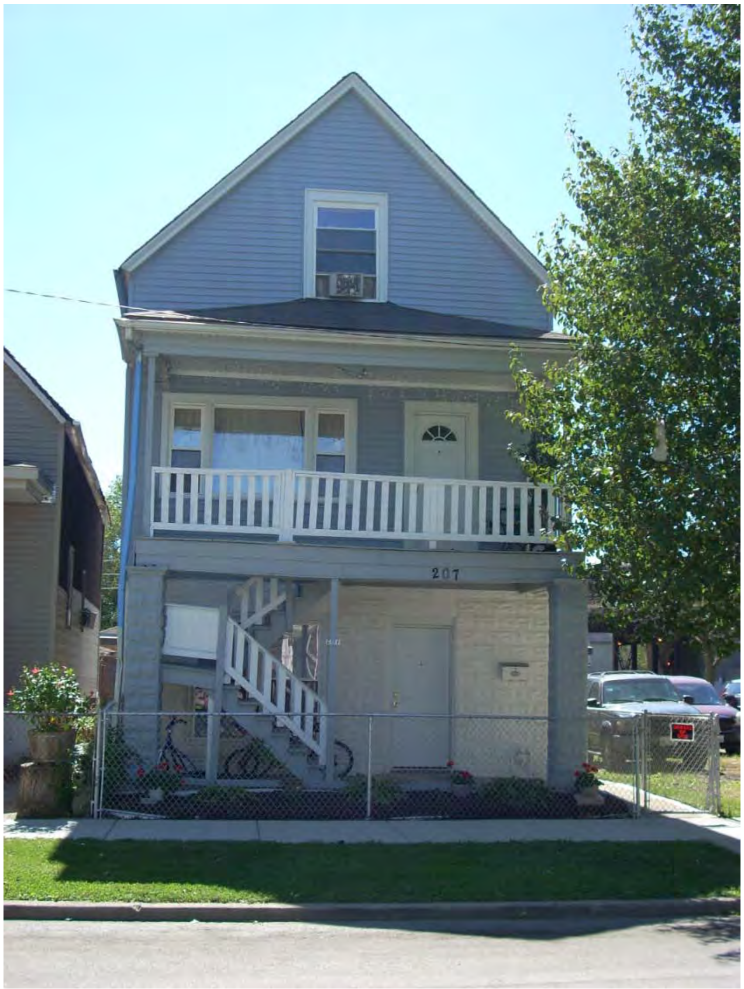
North façade of a 2.5-story, multi-family, frame residence.



Property Description: **Stories:** 2.5

This two-and-a-half-story frame house in the West Pullman community is clad in rusticated concrete bock on the first floor and in synthetic siding above. The building has a front gable roof with asphalt shingles. It has a two-story full-width, hip-roof wood porch/balcony with faux stone piers and wood posts as supports on the first and second floors, respectively. A non-original stairway leads to the second floor balcony. Both first and second floors have off-center non-original hollow core metal doors. Windows on the front elevation are non-original and include one on the first floor that is obscured by the staircase, a picture window flanked by one-over-one aluminum-sash windows on the second floor, and a single one-over-one aluminum-sash window in the gable. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

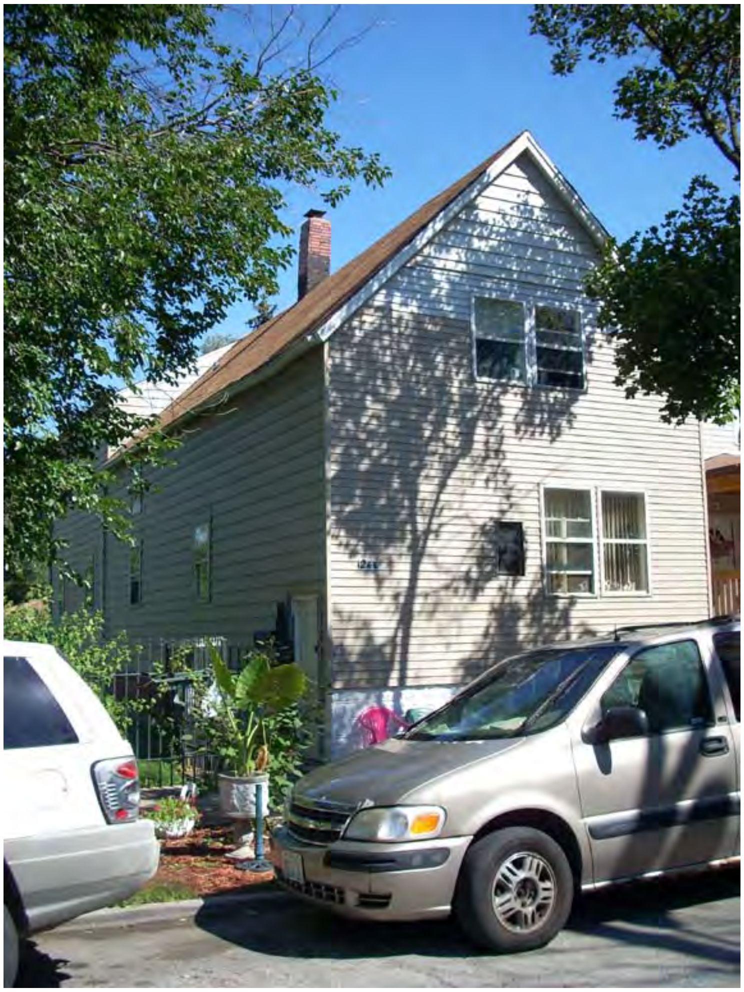
South façade of a 1.5-story, multi-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the West Pullman community is situated on a raised concrete block basement with glass block windows. It is clad with synthetic materials and has a gable roof covered with asphalt shingles and gable dormers along the side elevations. The front elevation has a strip of three windows on the first floor and one in the gable, all of which are non-original one-over-one aluminum-sash. The front door has been moved to the side elevation. This house lacks integrity, does not have distinguishing architectural features, and is not individually eligible for listing on the National Register.

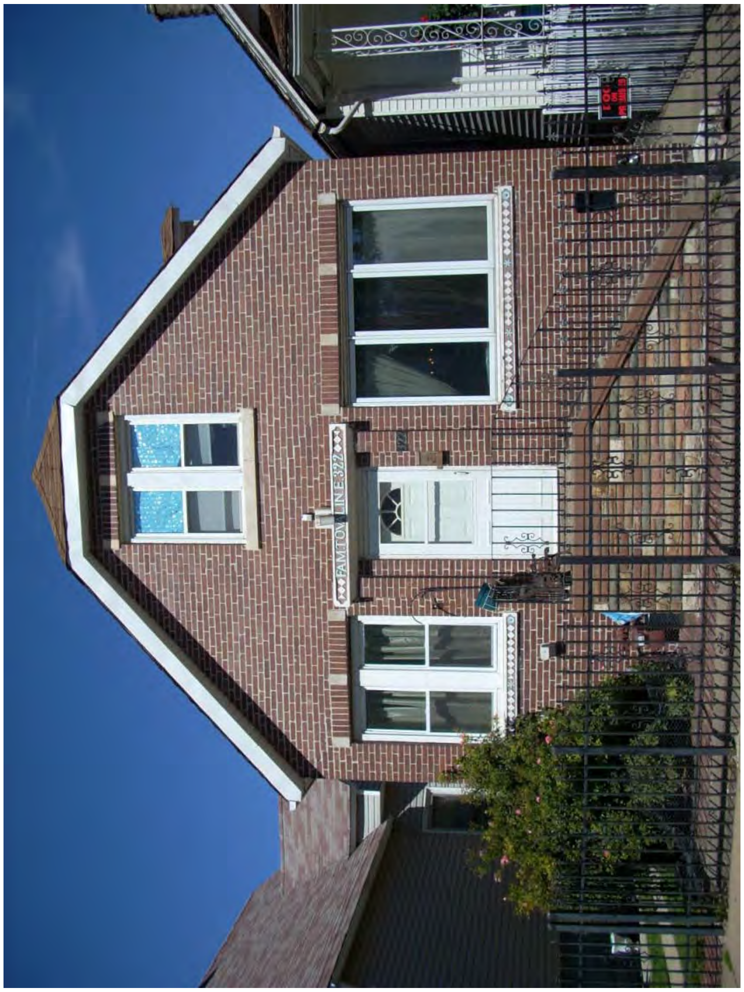
South façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story cottage in the West Pullman community is situated on a raised brick basement and has a hip-on-gable roof covered with asphalt shingles. Its front elevation is clad with brown face brick and has a central hollow core metal door flanked by a pair of one-over-one aluminum sash windows on one side and a strip of three casement windows on the other. The gable has a pair of one-over-one aluminum-sash windows. This elevation also has side-facing concrete steps faced with faux stone and metal railings. Detailing includes brick pilasters flanking the door, concrete sills, flat arch window lintels with square stone inserts, and a lintel above the door that reads: “FAM.TOVALIN.E.322.” This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story frame house in the West Pullman community is situated on a raised concrete block basement with glass block windows, is clad with synthetic siding, and has a gable roof with asphalt shingles. The fenestration pattern has been altered with the moving of the main entrance from the 118th Street elevation and the windows, which feature non-original casements and one-over-one non-original aluminum varieties on both the first and second floors. This house lacks integrity, does not have visible distinguishing architectural features, and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story frame cottage in the West Pullman community is situated on a raised basement and is covered with stucco. The building has a front gable roof covered with asphalt shingles and a gable dormer along its south elevation. It has a partial-width flat-roofed porch that appears to be concrete, with solid sidewalls, straight posts, and a stepped parapet. Its front elevation has an off-center non-original hollow core metal door and a three-sided window bay with single-pane window and transom in the center flanked by one-over-one aluminum-sash windows. There is a pair of sliding aluminum-sash windows in the gable with a lunette fixed-pane window above. Windows are modern replacements. While the stucco cladding is somewhat unusual for this community's housing stock, this particular house lacks integrity as well as architectural features that are distinctive enough to merit individual inclusion on the National Register.

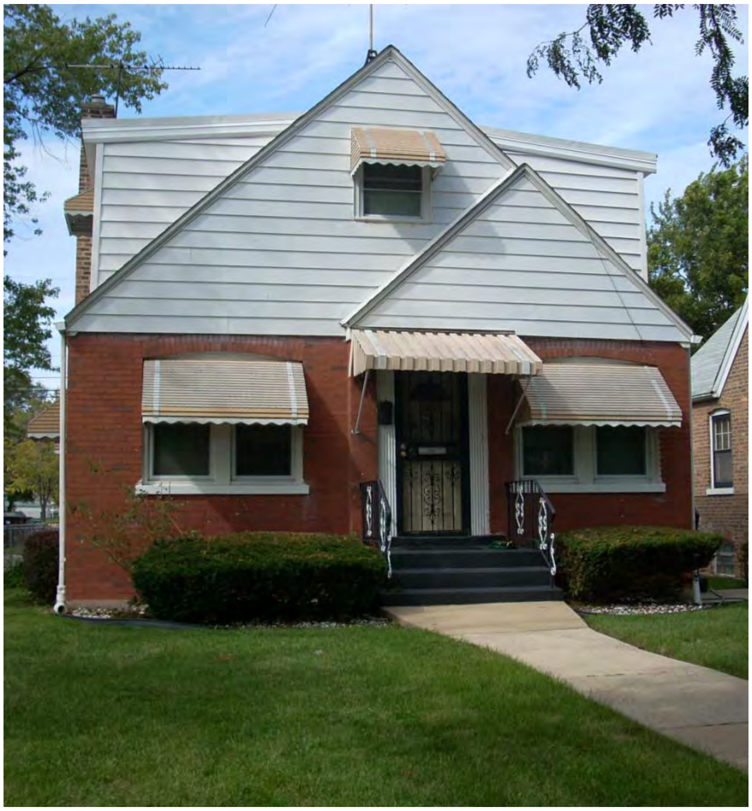
East façade of a two-story, brick and frame, single family residence.



Property Description: **Stories:** 2

This two-story cottage in the Washington Heights community has a gable roof covered with asphalt shingles and large, non-original, flat-roofed, aluminum-clad dormers on both side elevations transforming the original one-story building into a two-story residence. The front elevation is clad with orange face brick, the gables are clad with aluminum siding, and the lower side elevations are clad with common brick. The front elevation has a centrally located hollow core metal paneled door with fanlight, three concrete steps with metal railings, two pairs of windows on the first floor and a single window in the gable. Windows are non-original one-over-one aluminum sash. The front door and windows are sheltered by metal awnings. Detailing includes concrete sills and brick lintel arches. This house does not feature distinguishing architectural elements or sufficient integrity to be individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story bungalow at the northwest corner of Eggleston and 101st Street in the Washington Heights community is situated on a raised basement and is clad with brown face brick along its two street elevations. It has a hip roof covered with asphalt shingles and hip dormers along both its front and rear elevations. Its front elevation has a curved window group in the basement level with frosted glass casement windows. It has a recessed corner porch with carpeted concrete steps and corner brick pier support, a metal storm door, and a projecting living room bay with one-over-one windows that are partially obscured by a low metal awning. Detailing includes stone block inserts and a planter box. Its 101st Street elevation has glass block basement windows and one-over-one windows on the first floor. This house does not have sufficient distinguishing features to qualify as individually eligible for listing on the National Register.

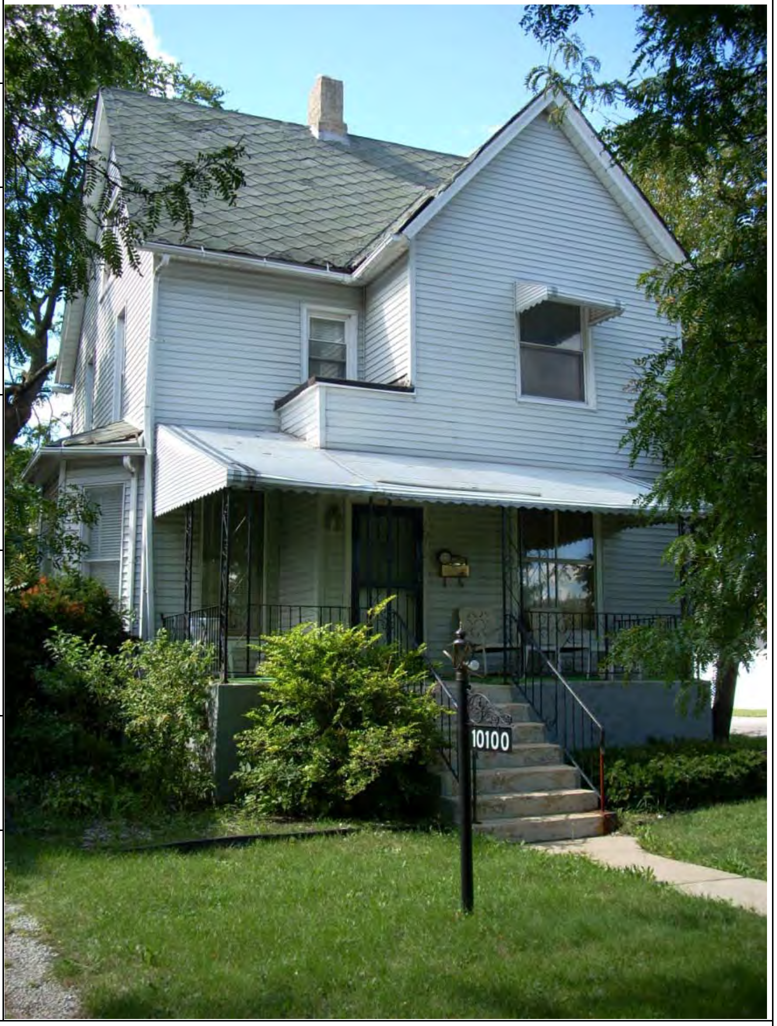
East façade of two-story, single family, frame residence.



Property Description: **Stories:** 2

This two-story frame house at the southwest corner of Eggleston and 101st Street in the Washington Heights community is situated on a raised stone block basement with glass block windows. It is clad with synthetic siding and has a cross-gable roof covered with asphalt shingles. Its front elevation has a metal storm door and a partial-width porch with concrete steps, metal railings, and open metal posts supporting a metal awning roof. Windows are non-original double-hung and come in varying sizes. Both side elevations feature window bays. This house does not have sufficient integrity or distinguishing features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story Craftsman bungalow at the northwest corner of Eggleston Avenue and 106th Street in the Roseland community is situated on a raised concrete block basement with glass block windows and is clad with synthetic siding. The building has a hip roof covered with asphalt shingles, overhanging eaves, decorative rafters, and a hip dormer. The residence has a recessed corner porch with a wood door, wood steps and railings, and a corner support consisting of a faux stone pedestal topped by a Doric column. The front (Eggleston) elevation has a picture window flanked by one-over-one aluminum-sash windows (non-original). The hip dormer has sliding windows, one of which is partially enclosed by plywood. The 106th Street elevation has a gabled pavilion, non-original one-over-one aluminum-sash windows, and a single casement window. This building does not have sufficient distinguishing architectural features or integrity to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story bungalow in the Roseland community is situated on a raised basement with glass block windows. The building is clad in brown brick, has a hip roof covered with asphalt shingles, and has overhanging eaves. The front and both side elevations feature large gable dormers and the rear elevation has a shed dormer, all of which are clad with aluminum siding. The house features a recessed corner porch with a metal storm door, concrete steps, low brick sidewalls, a brick corner pier, and arched front and side openings. The front elevation’s three-sided living room bay has six windows and the front gable dormer has three windows, all of which are non-original one-over-one aluminum-sash. Detailing includes brick soldier courses above and below the living room bay windows, decorative stone insert blocks, and concrete sills. This house does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the Roseland community area is clad with tan face brick on its front elevation and common brick on its side elevations. The building has a steeply-pitched side-gable roof covered with asphalt shingles and two synthetic-clad gable dormers with one-over-one windows. Its front elevation has a centrally located, gabled, brick-clad entrance vestibule, a metal storm door with an unadorned wood surround, concrete steps with metal railings, and two nine-over-nine windows. It lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

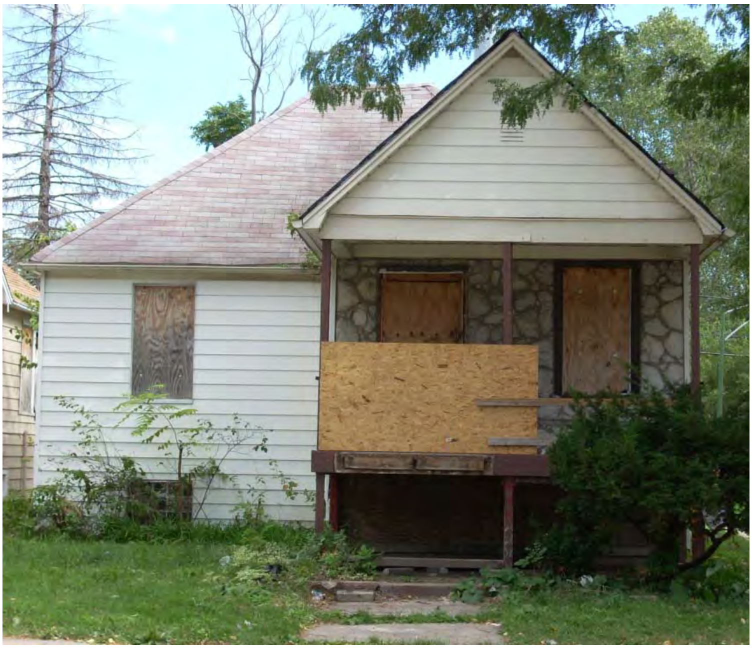
West façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story house at the northwest corner of Eggleston Avenue and 108th Street in the Roseland community is situated on a raised basement, is clad with synthetic siding, and has a hip roof covered with asphalt shingles. Its front elevation is partially clad with faux stone siding and has a partial-width porch with gable roof, wood deck, and post supports. The porch steps and railings have been removed; the front door and all window openings are covered with plywood. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

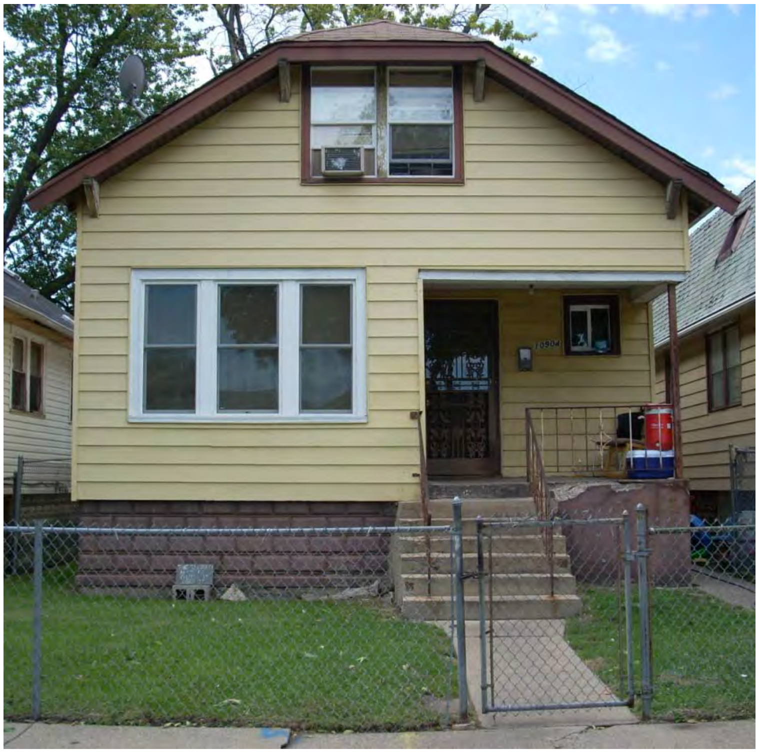
East façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story house in the Roseland community is situated on a raised concrete block basement and clad with synthetic siding. The building has a hip-on-gable roof covered with asphalt shingles and overhanging eaves with wood brackets. The front elevation has a recessed corner porch with concrete steps, metal railings, a single wood corner post, and an entrance with a metal storm door. Windows are non-original and include a small casement window adjacent to the front door, a strip of three one-over-one windows on the first floor, and a pair of one-over-one aluminum-sash windows in the attic. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

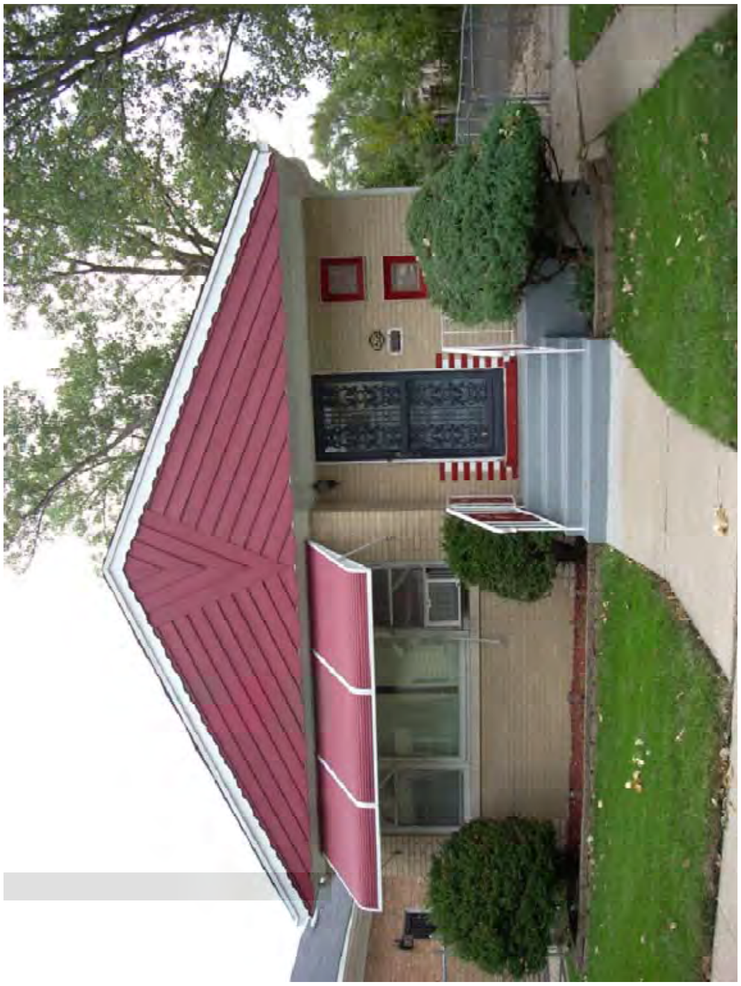
West façade one-story, brick, single-family residence.



Property Description: **Stories:** 1

This one-story house in the Roseland community with a raised basement is clad with buff brick on its front elevation and common brick on its side and rear elevations. The building has a front gable roof covered with asphalt shingles and has overhanging eaves. Its front elevation has a projecting three-sided living room bay with a picture window flanked by one-over-one aluminum-sash windows that are sheltered by a metal awning. The residence has an off-center entrance with a metal storm door, concrete steps with metal railings, and an wood-clad gable laid in diagonal patterns. Detailing includes two decorative glass blocks adjacent to the front door and scalloped trim around the gable. It does not feature distinctive architectural elements and is not individually eligible for listing on the National Register.

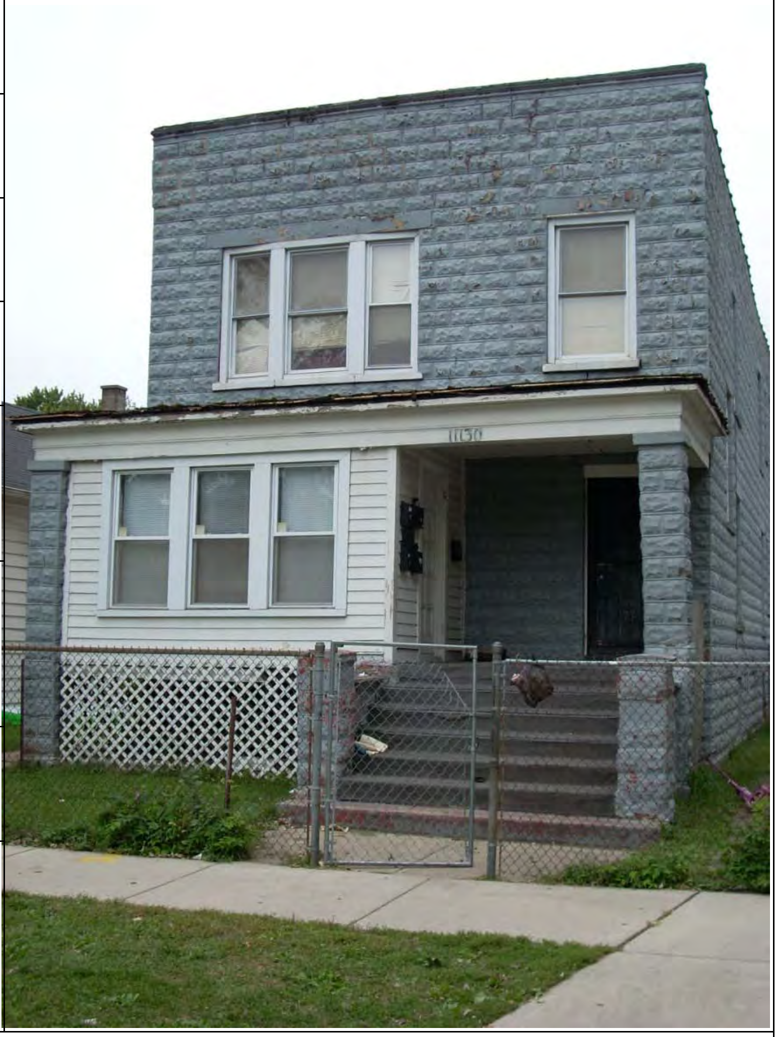
East façade of two-story, concrete block, two-flat residence.



Property Description: **Stories:** 2

This two-flat residential building in the Roseland community is situated on a raised basement and made of rusticated concrete block. The building has a flat roof and parapet. It features a flat-roofed full-width porch, half of which is enclosed and covered with aluminum siding. The enclosed porch has a strip of three non-original one-over-one aluminum-sash windows on its front elevation. The open half of the porch has an entrance with metal storm door, a faux stone corner support, and wood steps flanked by concrete block half-walls. The second floor of the front elevation has a strip of three windows and a single window, which are non-original one-over-one aluminum-sash and have stone sills and lintels. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

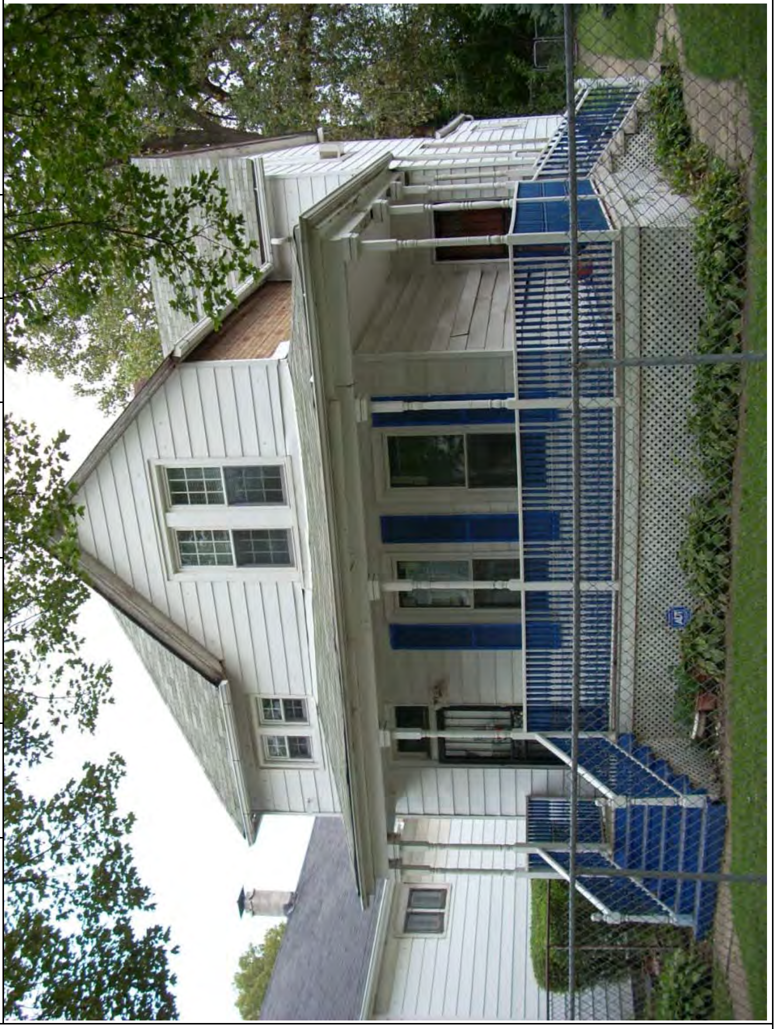
West façade of 1.5-story, single-family, frame residence.



Property Description: **Stories:** 1.5

This 1.5-story frame house in the Roseland community is situated on a raised basement and is covered with synthetic siding. The building has an original, full-width, hip-roofed wrap-around wood porch with turned posts and straight railings. It has a cross-gable-on-hip roof covered with asphalt shingles. Its front elevation has an off-center door with transom and two one-over-one windows. The second floor of the front elevation has two pairs of double-hung windows, one of which features nine-over-nine sashes. Windows are modern replacements. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

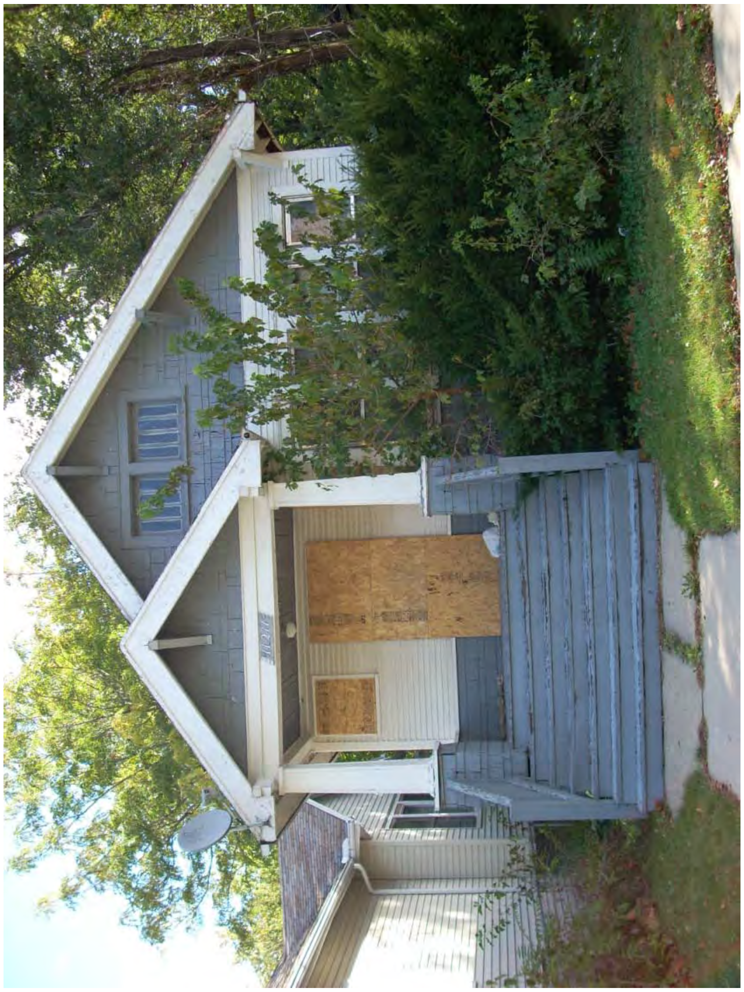
West façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman style bungalow in the Roseland community is situated on a raised brick basement and is clad with wood clapboards with wood shingles in the gabled ends. The building has a front gable roof covered with asphalt shingles and overhanging eaves with exposed rafters and decorative knee braces. The front elevation features a partial-width, front-gable, wood porch with squat, squared Doric columns and a boxed cornice. The porch door and adjacent window opening are covered with plywood. There is a group of four one-over-one windows on the first floor and a pair of original wood casement windows in the attic. This is an example of a Craftsman bungalow, an exceedingly common style during the 1910s and 1920s but lacks distinctive architectural features and is not individually eligible for listing on the National Register.

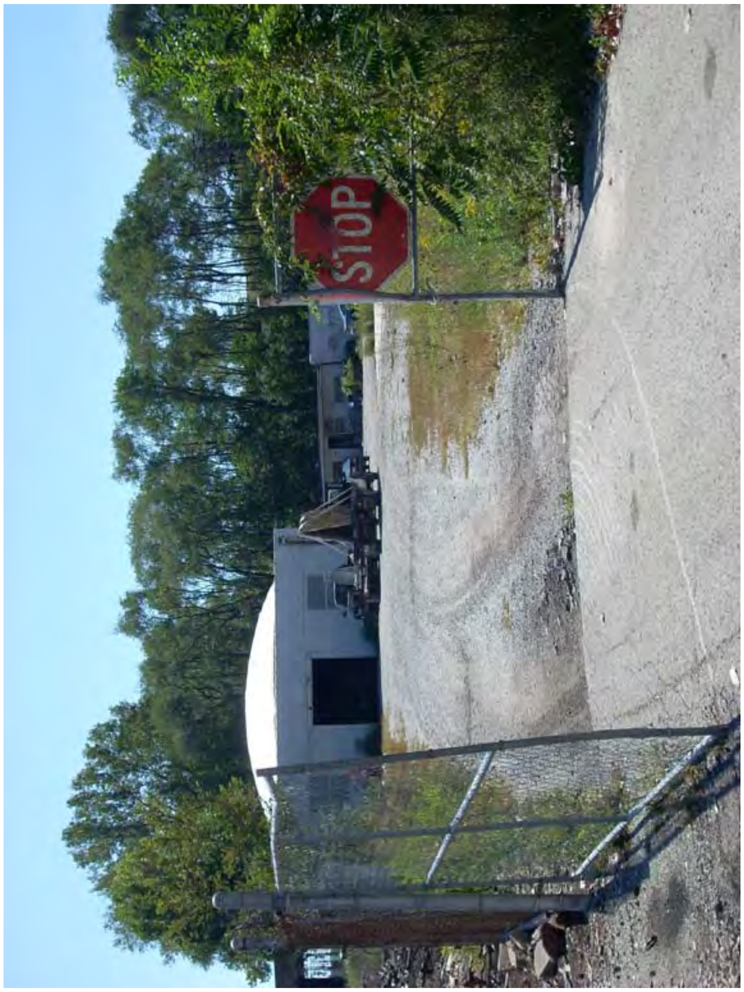
Looking south at light industrial complex.



Property Description: **Stories:** 1

This concrete block, Quonset utility outbuilding in the West Pullman community is set back from the public right-of-way and has a front elevation with a centrally located garage door opening flanked by a one-over-one window on either side. The 1962 aerial photograph shows two buildings on the property, the extant Quonset and a larger building. The larger building was razed between 2007 and 2012. A one-story building and a trailer standing on the remaining concrete slab from the larger, razed building are also part of this complex but too far from the road for evaluation. Windows appear to be fixed-pane on all buildings within the complex. This building complex does not have distinguishing architectural features and is not individually eligible for listing on the National Register.

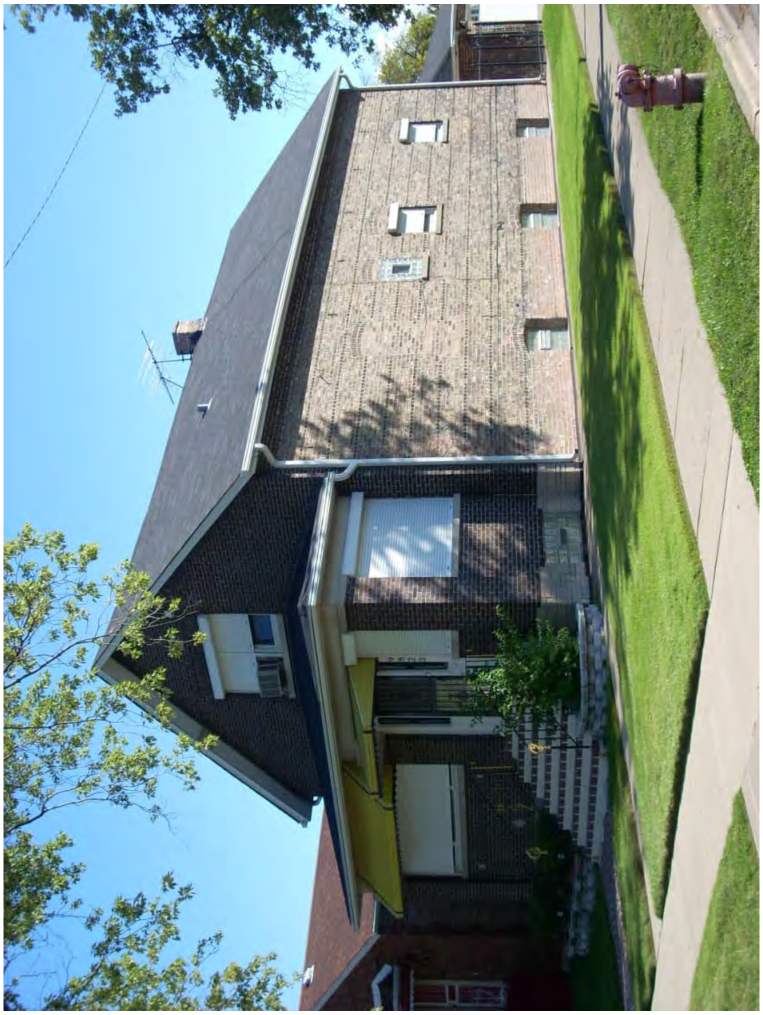
East and north façades, of 1.5-story, single family, brick residence.



Property Description: **Stories:** 1.5

This 1.5-story home in the Roseland community is situated on a raised brick basement with glass block windows and has a front gable roof covered with asphalt shingles. Its front elevation is clad with brown face brick, as is its enclosed, full-width, hip roof porch that has concrete lintels and sills. The front elevation has an off-center door with sidelights, metal steps and railings, and two first-floor window groups that are covered with metal screens, as were the paired windows in the gable. Some windows on the side elevation are in-filled with brick and glass block. This home lacks integrity and does not feature sufficient distinguishing features to qualify as eligible for individual listing on the National Register.

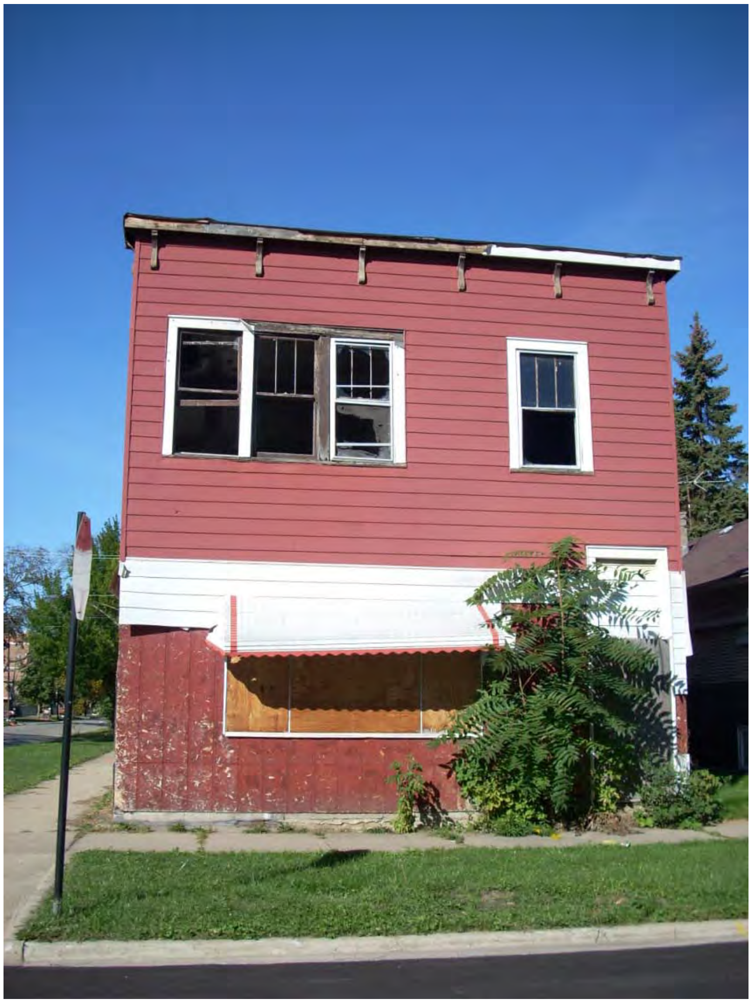
East façade of a two-story, multi-family, frame residence.



Property Description: **Stories:** 2

This two-story building at the northwest corner of Harvard Avenue and 114th Street in the Roseland community is clad with wood board vertically laid on the first floor and with synthetic siding on the second floor. The building has a flat roof and parapet. The front (Harvard Avenue) elevation has an off-center door and a group of three first floor windows that have been covered with plywood and are sheltered by a metal awning. The second floor of the front elevation has four windows—a group of three and a single window—that were formerly three-over-one wood-sash, although most of the glass panes are now gone. The front elevation is topped by a bracketed unadorned wood cornice. The windows on the 114th Street elevation have been covered with plywood on the first floor and have missing glass panes on the second floor. This former commercial building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

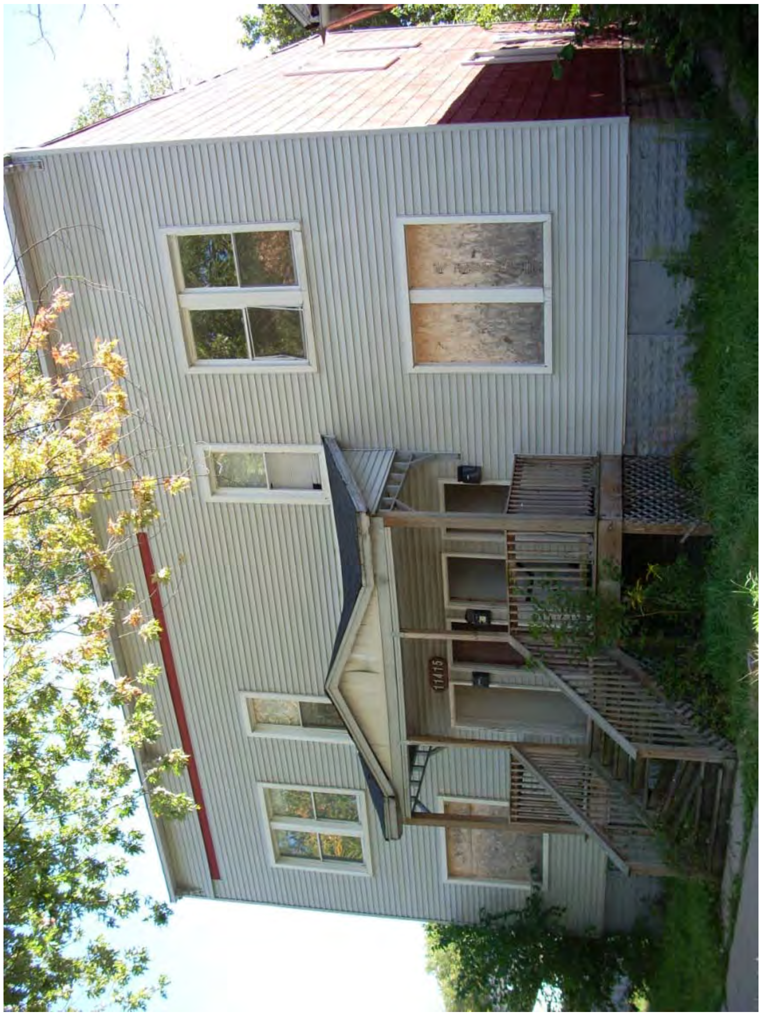
West façade of a two-story, four-flat, frame residence.



Property Description: **Stories:** 2

This two-story four-flat building in the Roseland community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a flat roof and parapet. Its front elevation has four centrally located doorways that lack doors, a partial-width wood porch with a gable-on-shed roof, non-original straight posts and railings. There are two window groups on the first floor that are covered with plywood and six non-original one-over-one aluminum-sash windows on the second floor. The parapet level features a bracketed unadorned cornice. This building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

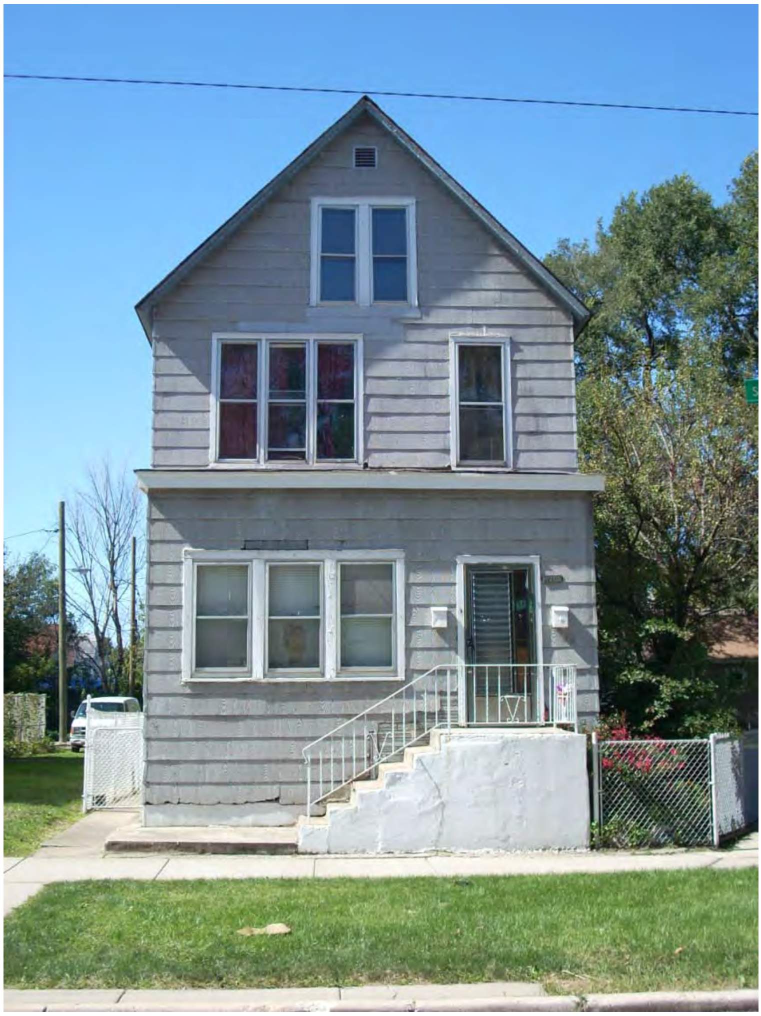
East façade of a two-story, multi-family, frame residence.



Property Description: **Stories:** 2

This two-story frame house at the southwest corner of Indiana Avenue and 117th Street in the West Pullman community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. Its front elevation has a full-width, flat-roof, enclosed sun porch with an off-center metal storm door, concrete steps with metal railings (non-original), and a strip of three windows on the first floor. The second floor of the front elevation has a strip of three windows and a single window, and the attic level has a pair of windows. Windows are non-original one-over-one aluminum-sash. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

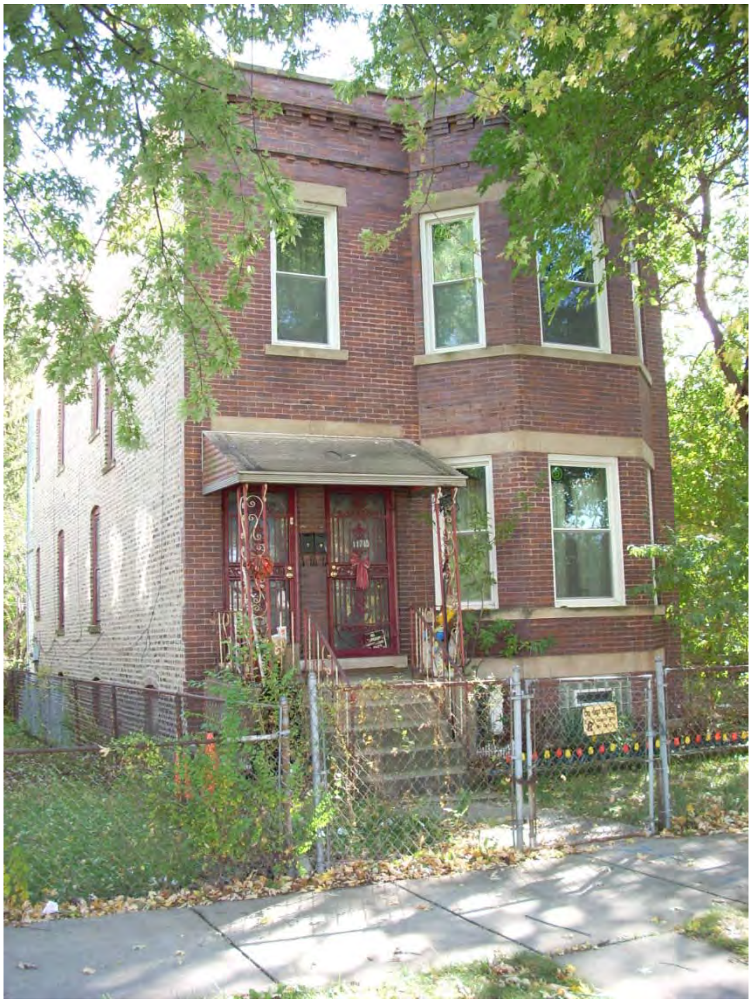
West façade of a brick, two-story, multi-family residence.



Property Description: **Stories:** 2

This two-flat, multi-family residential building in the West Pullman community is situated on a raised basement with glass block windows and is clad with face brick on the front elevation and common brick on the side and rear elevations. The building has a full-height window bay pavilion, a flat roof, and parapet. The front elevation has a partial-width porch with concrete steps and open metal posts supporting a metal shed-roof. A pair of off-center storm doors is located under the porch roof. There are seven non-original one-over-one windows: three on the first floor bay and four on the second floor, including three on its window bay. Detailing includes concrete sills, belt courses, brick cornice with corbelling, and brick dentils. This building lacks distinctive architectural features and is not individually eligible for listing on the National Register.

Photos with Captions:
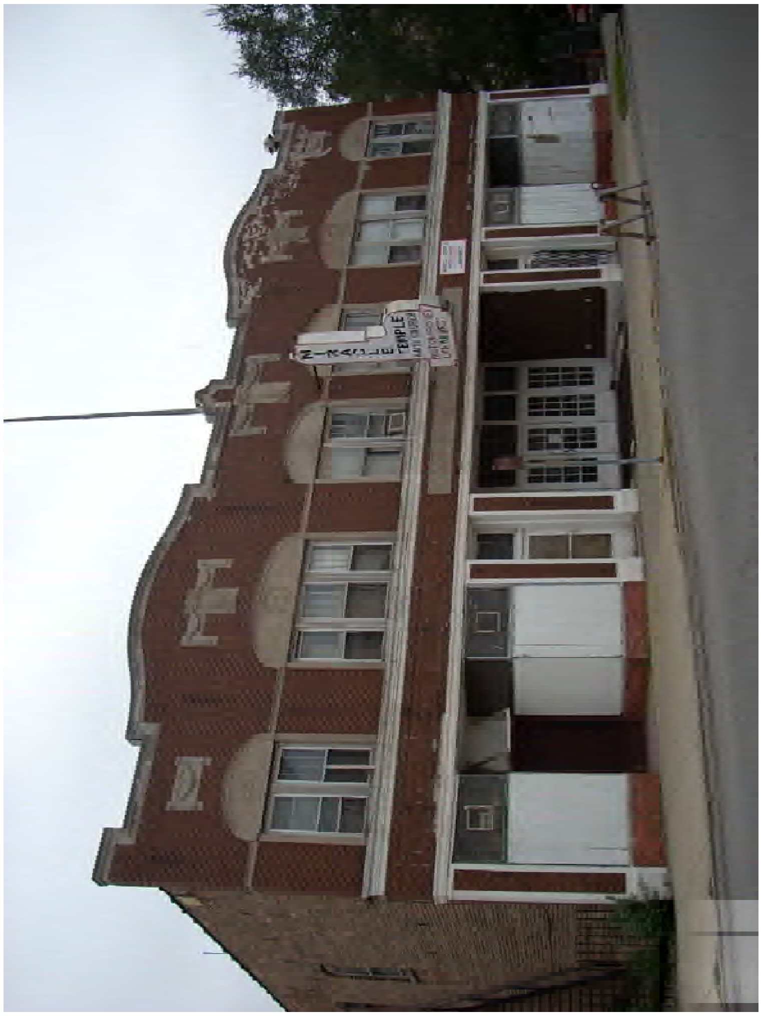
North façade of a brick, two-story, religious building.



Property Description: **Stories:** 2

This two-story building in the West Pullman community (formerly part of Kensington) was originally called "Venetian Hall." The performance hall was built for a cultural/recreational purpose, although it has long since been repurposed as a church. The 1938 Sanborn shows the hall with a stage, balcony, and place for storage of scenery. The street entrance was flanked by two storefronts in 1938, as it is now.

The building is clad with face brick on its front elevation and common brick on its side and rear elevations. The building has a flat roof and a shaped parapet with concrete coping. The first floor of the front elevation has a recessed centrally located bay with three pairs of multi-light wood doors and in-filled transoms. This central bay is flanked by two original storefronts with central recessed doors and flanking display windows that are covered with wood and topped by transoms that have been in-filled with glass block. Separating the central bay from the two flanking storefronts are two doors with transoms that provide access to the second floor. The spandrel area directly above the central entrance bay has a concrete sign plate with incised lettering that reads: “Venetian Hall.” Fenestration on the second floor features six-over-one and three-over-one wood-sash windows arranged in pairs and in groups of three, topped by round-arch stone lintels with rosette motifs. The parapet features a series of Classical shields and swags.

The exterior of this building has good overall integrity, although elements of the original storefronts materials are no longer extant. However, it does not display sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register for its architecture. Instead, is recommended for individual listing under Criterion A for its original use as a social venue for area residents in the early twentieth century. Local theater houses, such as the Venetian Hall, were jewels within the local communities. It's rare to see an early twentieth century neighborhood social hall that retains its original storefronts and is set within a residential area comprised of worker’s housing, rather than along a commercial thoroughfare. The opening of Illinois Terra Cotta works in the first half of the twentieth century brought Italians to Kensington; the area gradually became a center of South Side Italian-American life with the establishment of Venetian Hall and the nearby San Antonio de Padua (patron saint of Venice) Roman Catholic Church.

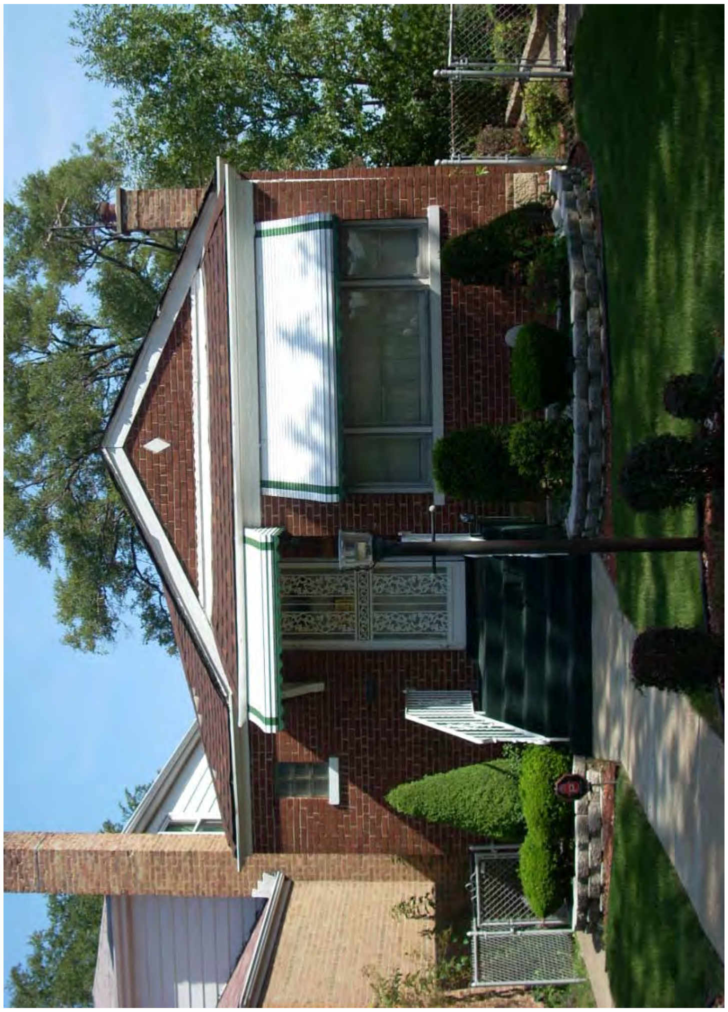
West façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised brick basement with casement windows and has a gable-on-hip roof clad with asphalt shingles. The front elevation has a pent roof, an off-center door, concrete steps with metal railings, a small glass block window, and a picture window flanked by casements. This window group is partially obscured by a low metal awning. Detailing includes a diamond-shaped tile insert in the gable end, stone quoins near the base of the residence, concrete sills, and scalloped boards above and below the pent roof. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

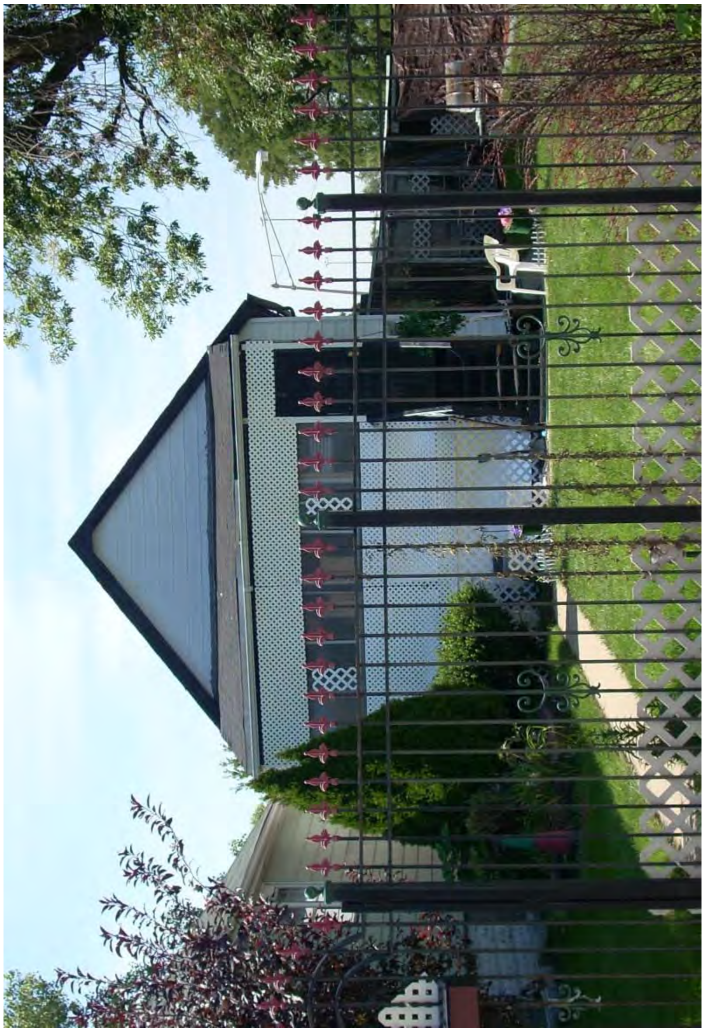
East façade of a one-story, frame, single family residence.



Property Description: **Stories:** 1

This one-story cottage in the Roseland community is situated on a raised brick basement with glass block windows, is clad with aluminum siding, and has a front gable roof covered with asphalt shingles. A non-original, full-width, enclosed front porch covered with lattice obscures the original front elevation of the house. The porch has a horizontal strip of square, non-original windows and an off-center door. The side elevations have one-over-one windows. This home does not have sufficient integrity or distinguishing features to qualify as eligible for individual listing on the National Register.

Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised brick basement and has a front gable roof covered with asphalt shingles. Its front elevation is clad with faux stone below the sill line, orange face brick above, and synthetic siding in the gable. It has a centrally-located door, concrete steps with metal railings, a single-pane window flanked by a casement, and what appears to be a pair of casement windows. Windows are partially obscured by low metal awnings. This standard 1950s era house does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

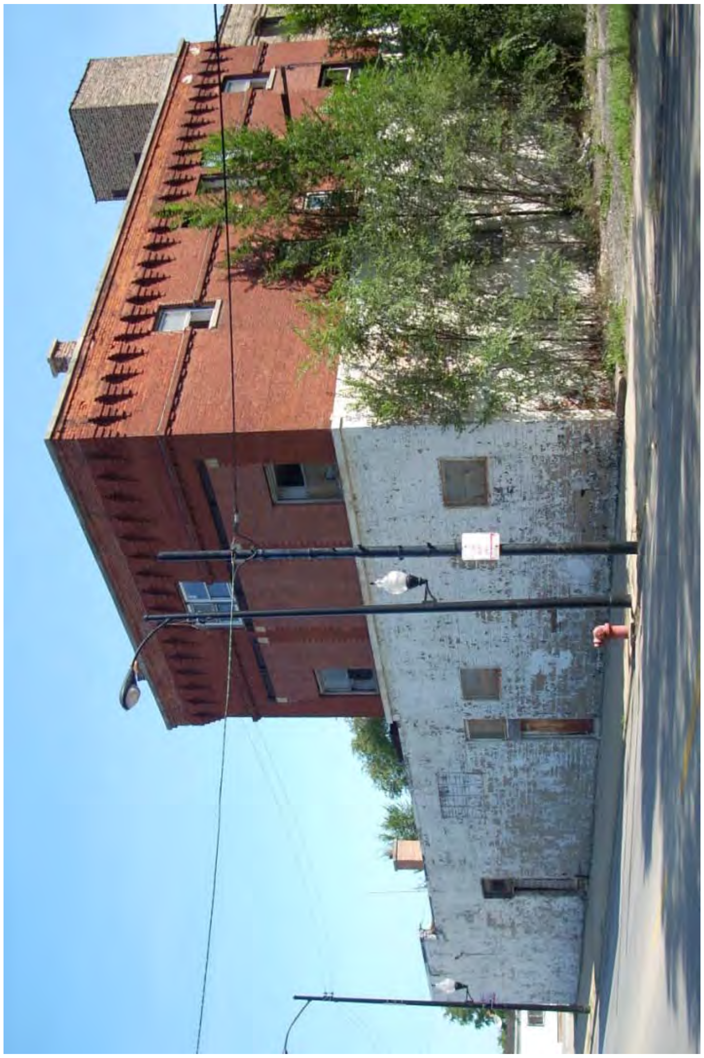
North and east façades of two-story, brick, industrial building.



Property Description: **Stories:** 2

This two-story industrial building in West Pullman has a flat roof and parapet. A one-story, flat-roofed north wing is a later addition (1962). The original building has been drastically altered with new brick cladding on the first floor and the removal of original doors and windows on the front elevation. The first floor of the front elevation currently features two small non-original windows. The original window openings on the second floor of the front elevation have been in-filled with brick. Two one-over-one windows have been installed on either side. Window openings on the side elevations have all been altered as well. The parapet retains original decorative brick corbelling along the front and side elevations. This building does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

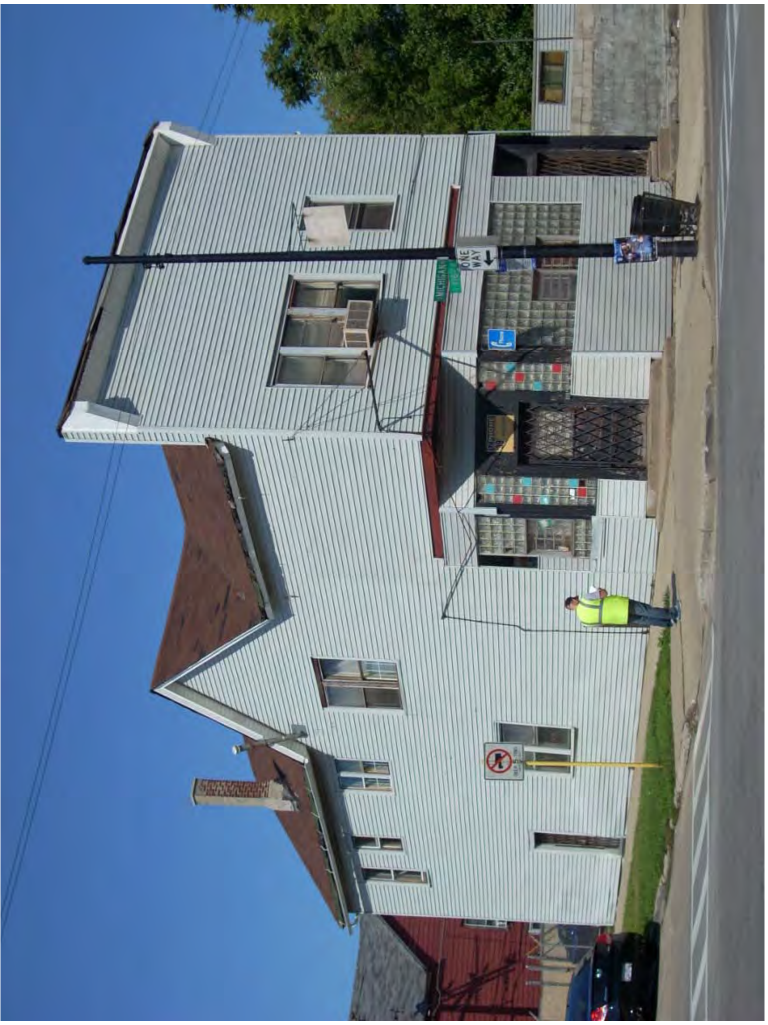
East and south façades of two-story, frame building.



Property Description: **Stories:** 2

This two-story frame building at the northwest corner of Michigan Avenue and 116th Street in the West Pullman community is clad with synthetic siding and has a cross-gable roof covered with asphalt shingles. Its front (Michigan Avenue) elevation features a tall false front, a recessed corner storefront entrance flanked by non-original glass block windows, an off-center metal door with transom that provides access to second floor apartments, and four one-over-one windows. Fenestration along the 116th Street elevation is also comprised of one-over-one windows. This building does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

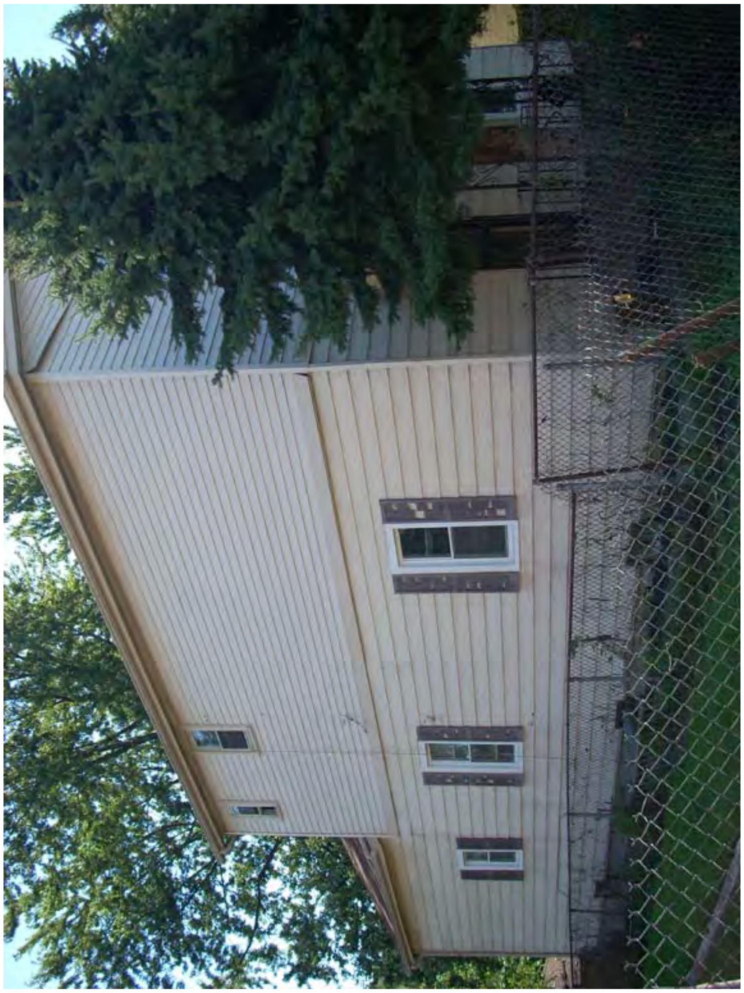
West and north façades of two-story, multi-family, frame building.



Property Description: **Stories:** 2

This two-story frame house in the West Pullman community is clad with synthetic siding and has a front gable roof with asphalt shingles. Its front elevation features an off-center non-original hollow core metal door fronted by a concrete stoop with metal railings and open metal posts supporting a metal canopy. There are two windows on the first floor and two on the second, all of which are non-original one-over-one aluminum sash.

The 1938 Sanborn shows this residence as a 1.5-story building with a round bay pavilion. Subsequent alterations, including the addition of a full second floor have heavily altered this building. This house lacks integrity, does not have distinguishing architectural features, and is not individually eligible for listing on the National Register.

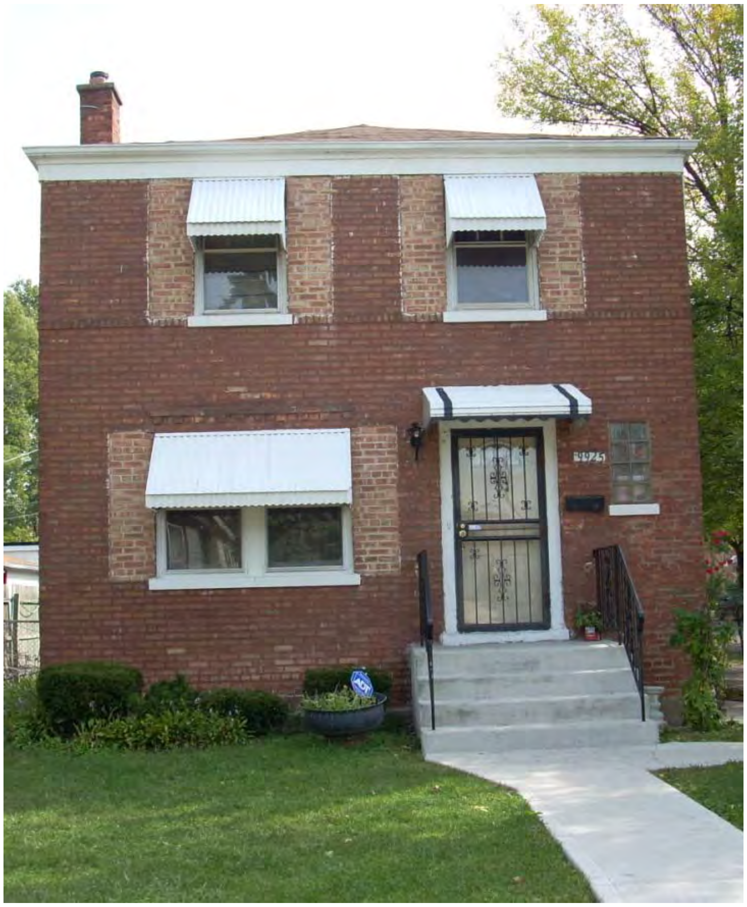
West façade of two-story, brick, single-family residence.



Property Description: **Stories:** 2

This two-story brick-clad house at the southeast corner of Normal Avenue and 99th Place in the Washington Heights community is situated on a raised basement with glass block windows. The building has a hip roof covered with asphalt shingles. Its front elevation has an off-center non-original hollow core metal door, a small adjacent glass block window, concrete steps with metal railings, a pair of non-original double-hung windows on the first floor, and two non-original double-hung windows on the second floor. The door and all front elevation windows have metal awnings. Details include a brick stringcourse and corbelling above first floor window. The difference in the brick colors relates to the removal of shutters. It does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

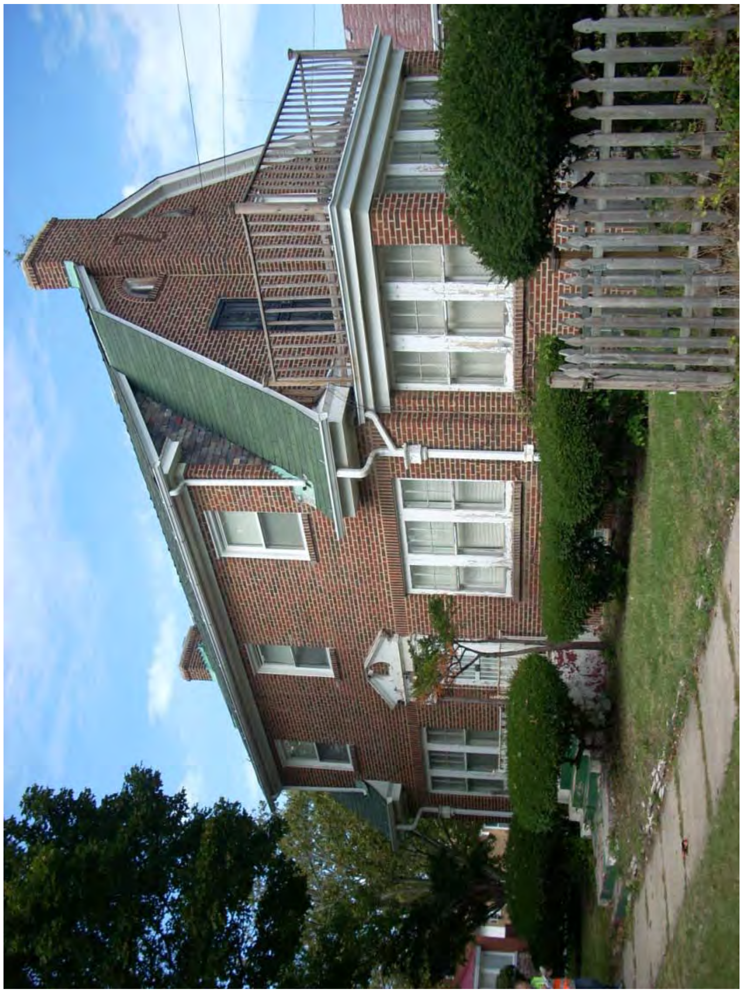
South and west façades of a brick, two-story, single family residence.



Property Description: **Stories:** 2

This two-story Dutch Colonial style house at the northeast corner of Normal Avenue and 105th Street in the Roseland community is situated on a raised basement and is clad with red face brick. The building has a side-gambrel roof covered with asphalt shingles, a one-story flat-roofed enclosed sun porch surrounded by four-over-one wood-sash windows along its east elevation, and exterior chimneys on both side elevations. The front (105th Street) elevation has a centrally located non-original hollow core metal paneled door, concrete steps, and metal railings. The door was once flanked by fluted pilasters with geometric capitals. The shaft of one of these pilasters has been removed as has the base of the extant pilaster. The door is topped by an unadorned frieze band and a broken pediment and is flanked by strips of three six-over-one and four-over-one wood-sash windows on either side. The shed-roofed second floor of the front elevation has three non-original one-over-one aluminum-sash windows. This house does not have sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

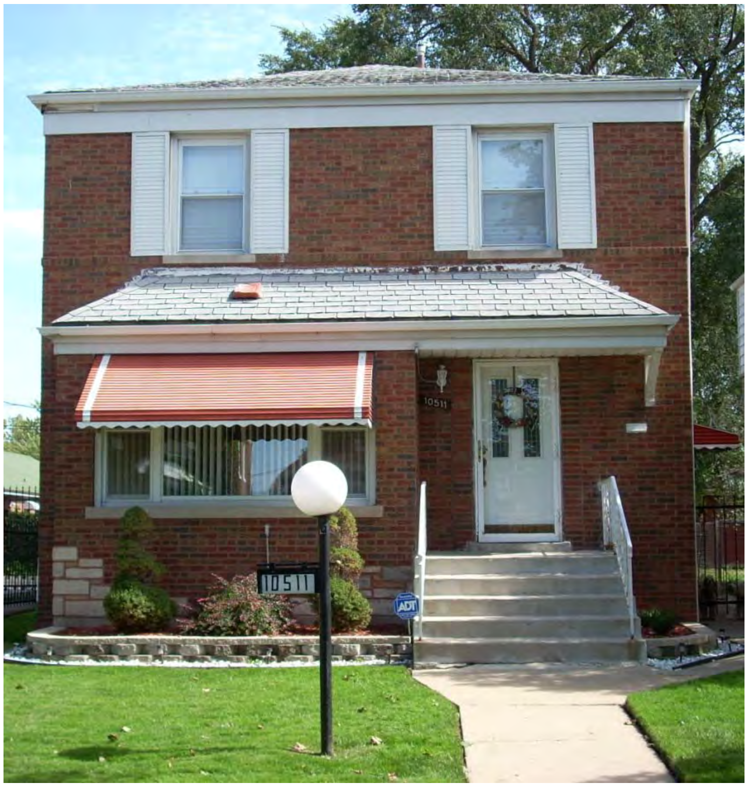
West façade of a brick, two-story, single family residence.



Property Description: **Stories:** 2

This two-story brick-clad house in the Roseland community is situated on a raised basement with glass block windows and has a hip roof covered with asphalt shingles. Its front elevation features a pent roof that spans the three-sided living room bay and an off-center hollow core metal door that is accessed by concrete steps with metal railings. The living room bay features a picture window flanked by non-original one-over-one aluminum-sash windows that are sheltered by a metal awning. The second floor of the front elevation has two non-original one-over-one aluminum-sash windows. Detailing includes concrete sills and decorative stones at the basement level. It does not feature distinguishing architectural features nor does it retain sufficient integrity, therefore, is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story bungalow in the Roseland community is situated on a raised basement with glass block windows and clad with brown brick. The building has a hip roof covered with asphalt shingles, overhanging eaves, and a hip dormer, the windows of which were obscured by foliage. The house features a recessed corner porch with a hollow core metal door, concrete steps, low brick sidewalls, and a brick corner pier. The front elevation’s projecting living room bay has a series of double-hung windows, a decorative brick soldier course, stone insert blocks, and concrete sills. This house does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story Ranch house at the corner of Normal Avenue and 107th Street in the Roseland community is situated on a raised basement and is clad with orange face brick below the sill line and buff brick above. The building has a cross-gable roof covered with asphalt shingles; gable ends are clad in synthetic siding. A gabled rear wing contains an attached two-car garage. The front (Normal Ave.) elevation has an off-center metal storm door sheltered by a roof overhang supported by a corner open metal post, concrete steps with metal railings, two pairs of non-original one-over-one aluminum-sash windows, and a non-original picture window flanked by one-over-one aluminum-sash windows on the main block. The front elevation of the rear wing has an off-center metal storm door, a roof overhang supported by two open metal posts, and a large glass block window. The side (107th Street) elevation has corner windows that are obscured by foliage but appear to be casements. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story Craftsman cottage in the Roseland community has a side-gable roof with overhanging eaves and decorative knee braces. The building is made of masonry units with aluminum siding in its gabled ends. Its front elevation has a recessed corner porch with overhanging gable roof with rafter tails, low walls, and squat, squared wood column supports. The building features a front door tucked into the side of the living room bay, a strip of three casements, and a picture window flanked by what appear to be casements. All windows on the front elevation feature concrete sills. Side elevation windows appear to be non-original one-over-one aluminum-sash. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

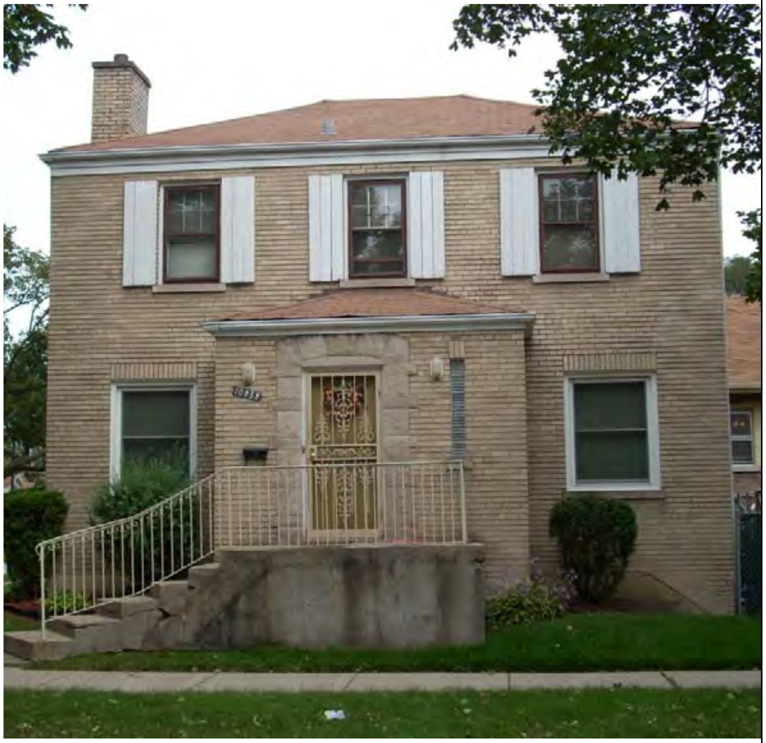
South façade of two-story, brick single-family residence.



Property Description: **Stories:** 2

This two-story house at the corner of Normal Avenue and 110th Street in the Roseland community is clad with buff brick and has a hip roof covered with asphalt shingles, an exterior buff brick chimney, and a raised basement. Its front elevation features a centrally located hipped-roof entrance vestibule with a door that is surrounded by decorative stones. A vertical strip of glass blocks adjacent to the door accents the façade. Concrete steps and metal railings lead to the entrance. There are five windows—two on the first floor and three on the second. The first floor windows are non-original one-over-one aluminum-sash while the second floor windows are six-over-one. Detailing includes concrete sills and brick flat arch window lintels. This house lacks sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

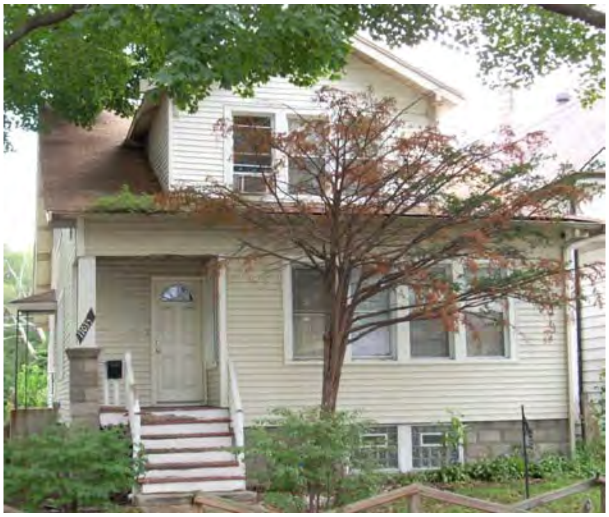
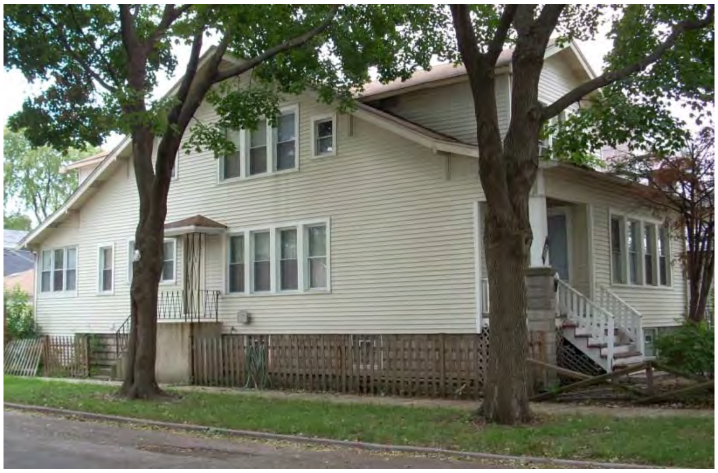
West façade of one-story, single family, frame residence.



West and north façades of residence.



Property Description: **Stories:** 1

This single story frame house at the southeast corner of Normal Avenue and 110th Place in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a side gable roof covered with asphalt shingles and flared, bracketed, overhanging eaves. It features both front and rear gable dormers. It has a recessed corner porch with non-original hollow core metal door, a faux stone corner pier topped by a squat squared wood column, and wood steps and railings. The front elevation has a strip of four windows on the first floor and three in the gable. Above the basement, windows are non-original one-over-one aluminum-sash. A small hip-roofed porch is situated along the 110th Place elevation with hollow core metal door (non-original), concrete steps with metal railings, and open metal supports. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

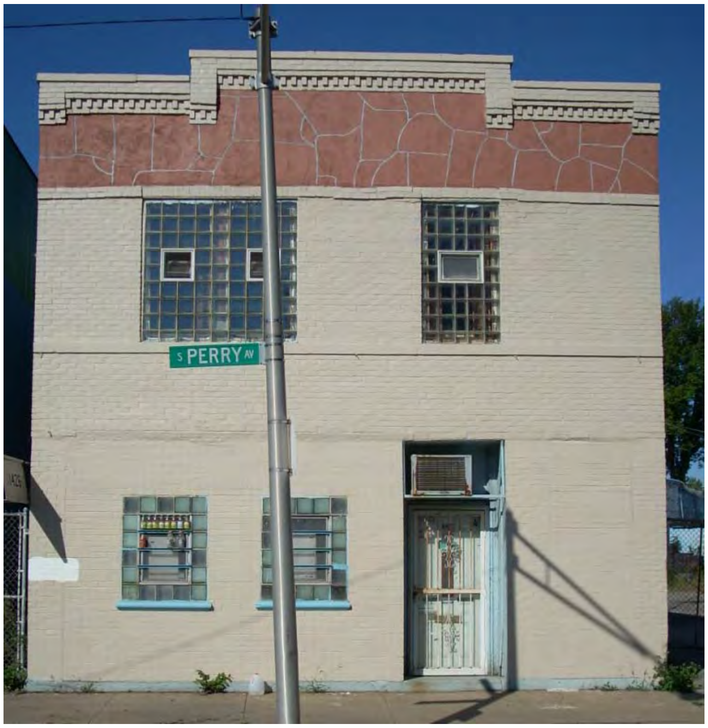
East façades of brick building in industrial complex.



Property Description: **Stories:** 2

This two-story industrial building in the Roseland community has a flat roof and parapet. It sits within an industrial complex bounded by South Perry Avenue, an alley, and the Union Pacific Railroad line. Its front elevation is clad in painted brick. It has a hollow core metal door with in-filled transom and window openings on the first and second floors that are in-filled with glass block with louvered or casement insets. Most of the face brick at the parapet level has been replaced by a stucco-like material. The uppermost portion of the stepped parapet has bricks arranged as decorative dentils. Other buildings within the paint company complex include one-story sheet metal and brick buildings. These buildings lack integrity, do not have distinguishing architectural features, and are not individually eligible for listing on the National Register.

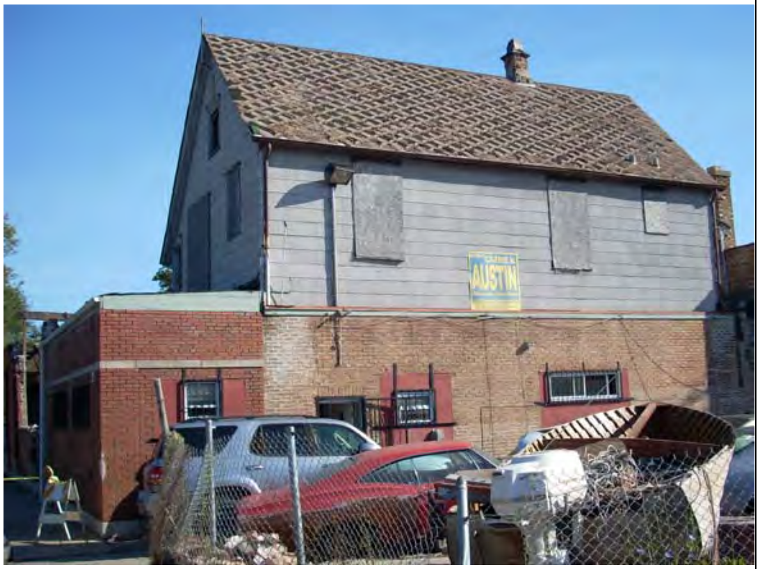
South façade of "building A" in a set of three joined industrial buildings. (Additional photographs appended).



Property Description: **Stories:** various

This industrial complex of buildings in the Roseland community includes three conjoined brick buildings: a two-story gable-roofed building (A, photo above), a collapsed brick building (B, photos on page 3), and a two-story flat-roofed brick building (C, photos on page 3). Building A has first floor clad in brick with a one-story, flat-roofed, brick commercial wing in front. The upper half of this building is clad in synthetic siding covering clapboards. It is vacant, deteriorated, and many of its window openings have been covered with particle board. Windows along the south side on the first floor are sliding or double-hung. Building B has collapsed. Building C at the far north has a parapet and is clad with red face brick and common brick. The windows with arched lintels have been in-filled with wood and brick. A new door pierces the façade. This complex of building lacks integrity, does not have any distinguishing architectural features, and is not individually eligible for listing on the National Register.

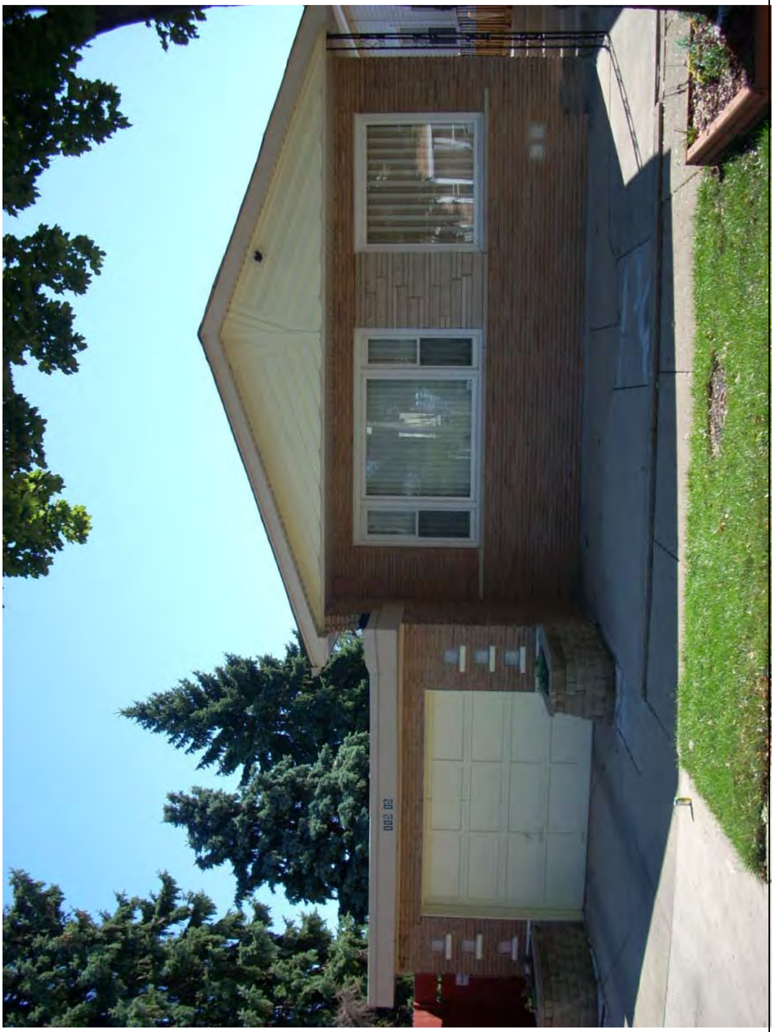
West façade of one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story house in the West Pullman community has a gable roof covered with asphalt shingles, overhanging eaves, and a flat-roofed attached one-car garage. Glass blocks with stone sills and brick planter boxes decorate the front of the garage. The front elevation of the house is clad with light orange face brick and features two picture windows, one of which is flanked by narrow one-over-one windows. A stone panel separates the two picture windows. The front gable is clad with synthetic siding in a decorative pattern. The entrance is located along the side elevation and accessed via a flight of concrete steps with metal railings. This house does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

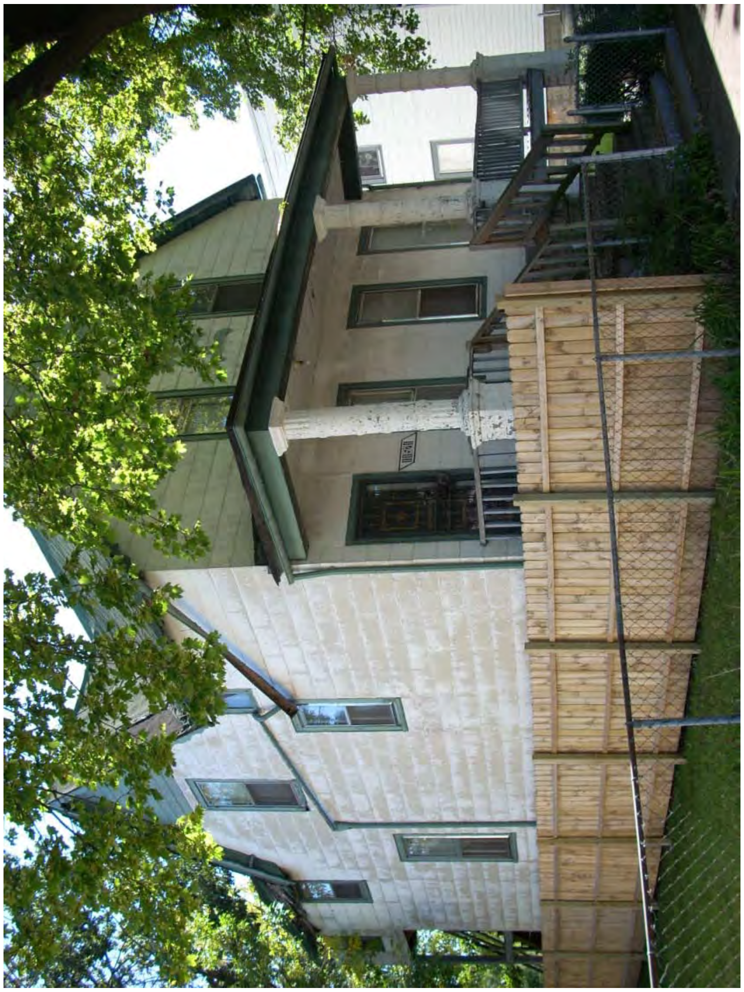
West façade of a 1.5-story, multi-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the West Pullman community is situated on a raised concrete block basement and is clad with synthetic siding. The building has a cross-gable roof covered with asphalt shingles. The front elevation has a full-width wood porch with a flat roof that is supported by faux stone piers topped by short Doric columns. The façade features an off-center non-original hollow core metal door and five non-original one-over-one aluminum-sash windows: three on the first floor and two on the second. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

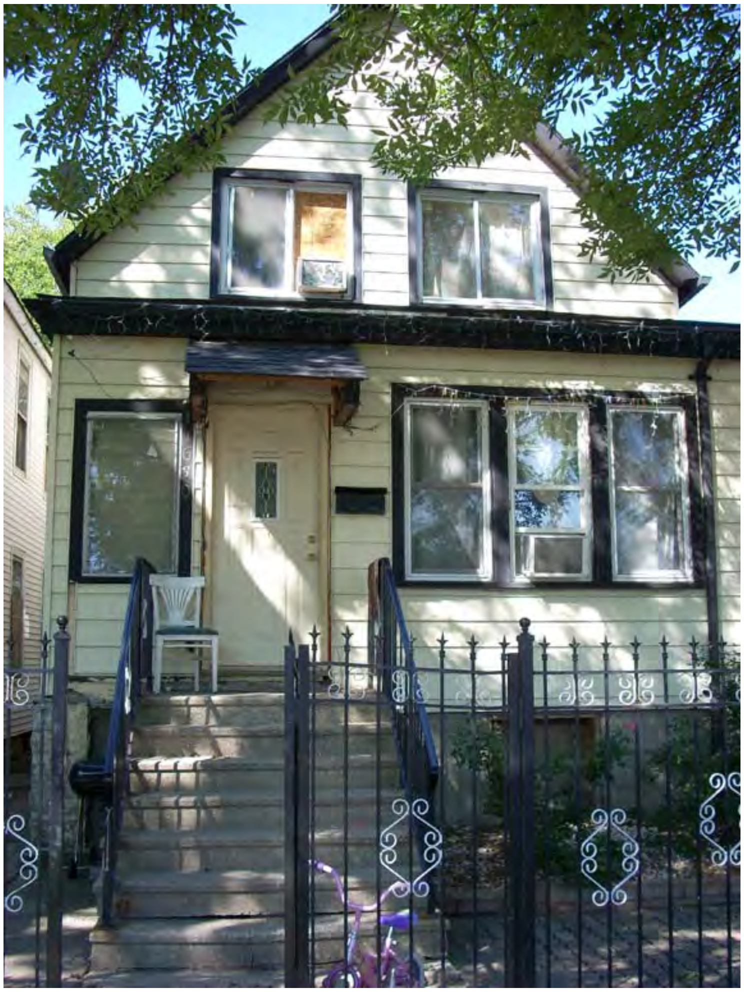
East façade of one-and-a-half-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the West Pullman community is situated on a raised brick basement, is clad with synthetic siding, and has a front gable roof with asphalt shingles. Its front elevation features a flat-roofed enclosed porch with concrete steps with metal railings. It also has a hollow metal core door, four non-original windows on the first floor—one casement and a strip of three one-over-one windows—and two paired windows on the second floor, one of which is in-filled with plywood. This house lacks integrity, does not have distinguishing architectural features, and is not individually eligible for listing on the National Register.

Photos with Captions:
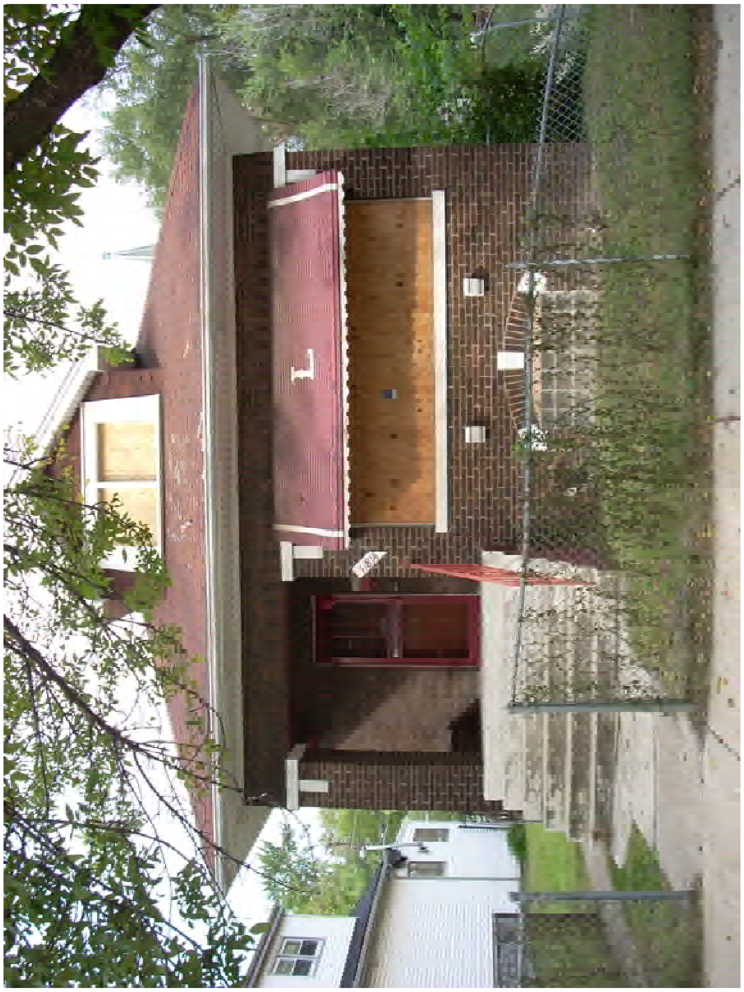
East façade of a one-story, single family, brick residence.



Property Description: **Stories:** 1

This one-story brick-clad bungalow in the West Pullman community is situated on a raised basement with glass block windows. The building has a hip roof covered with asphalt shingles, overhanging eaves, and gable dormers along its front and rear elevations. The front elevation has a recessed corner porch with a brick pier support at the corner, concrete steps, and a metal railing. Above the basement, windows have been covered with plywood. Detailing includes soldier brick lintels, concrete sills, and concrete insert blocks used as decorative accents. This is an example of a Chicago bungalow, a building type that the City of Chicago has recognized through its Historic Chicago Bungalow Initiative. However, this house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

South façade of two-story, multi-family residence.

Property Description: **Stories:** 2

This two-story multi-family building at the northwest corner of 100th Street and Princeton Avenue in the Roseland community is clad with brown face brick along its two street elevations. It has a raised brick basement with glass block windows, a hip roof covered with asphalt shingles with overhanging eaves, a shed dormer along its 100th Street elevation, and a hip dormer along its rear elevation. The front elevation has an off-center hollow core metal door with two strips of three windows—one on the first floor and one on the second—along with an additional window on the second floor. Fenestration along both street elevations is comprised of three-over-one wood-sash windows. Detailing includes concrete sills, window surrounds with soldier bricks and square concrete insert blocks, and a course of soldier bricks above the first floor windows that spans both street elevations. The brick panels above both the front and side doors feature the same decorative basketweave pattern. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

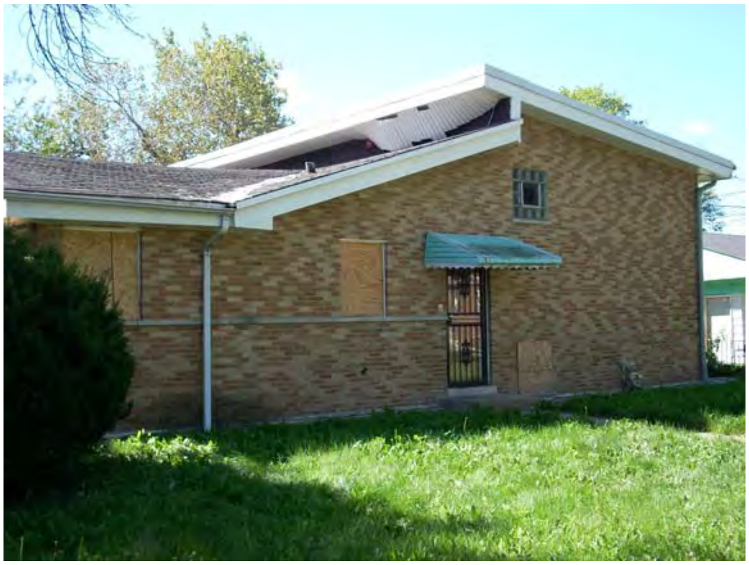
North façade of split-level showing roofline.



Property Description: **Stories:** 1

This split-level home in the Roseland community has a cross-gabled roof covered with asphalt shingles and is clad with buff and orange face brick. The front elevation’s gable is clad with aluminum and has a deep overhang that is supported by two open metal posts. The roofline exhibits an overhanging shed roof along the ridgeline, running the width of the house. The eave of this overhang is clad in vinyl siding. The front elevation’s windows and door are obscured by high foliage. Three of the four side elevation windows are covered with plywood. This house does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

This two-story house in the Roseland community is situated on a raised brick basement. It is clad with brown face brick and has a cross-gable roof covered with asphalt shingles. Its front elevation has an arched basement window group, an off-center door with a metal storm, a corner recessed porch with concrete steps and metal railings, a projecting three-sided hip-roofed living room bay with five double hung sash windows, and a strip of three one-over-one windows on the second floor. Detailing includes a stone sill course and a decorative soldier course with stone insert blocks above the living room bay windows, decorative scrolled stone brackets below the living room bay windows, and a porch archway with stone keystone. The side elevation has a shed-roofed window bay with large glass block window opening. The rear elevation's original roofline has been raised with a shed-roofed addition. This house does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

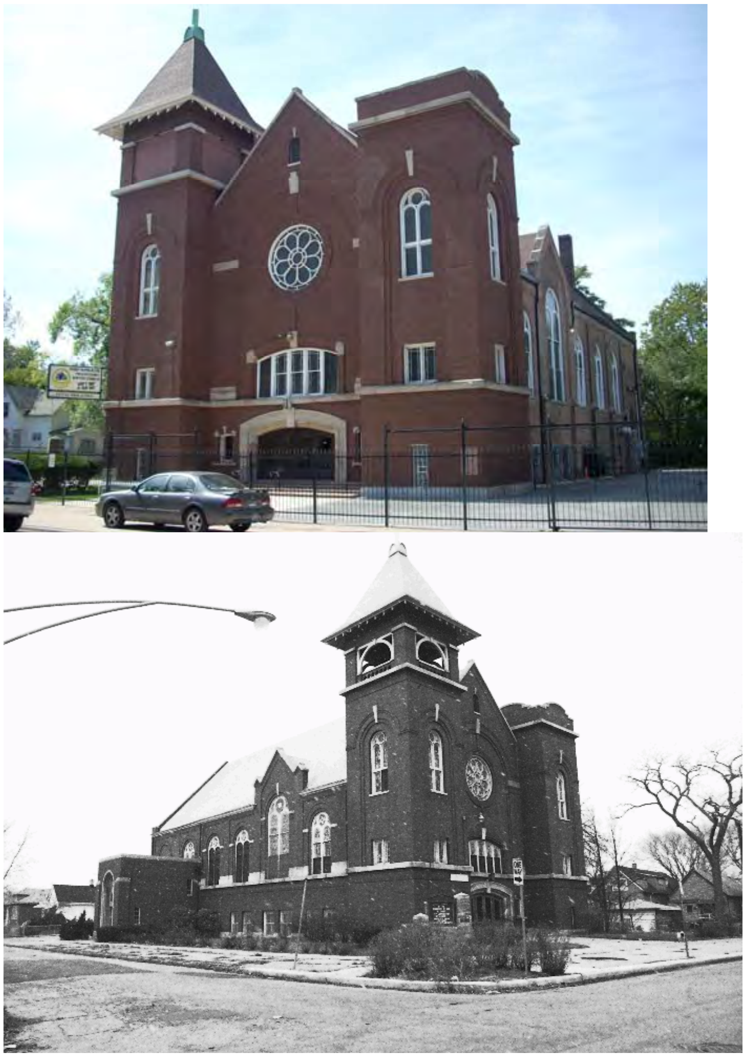
East façade of two-story religious building (above), south and east facades from HAARGIS (below).



Property Description: **Stories:** 2

This Romanesque Revival style church in the Roseland community has a front elevation and two flanking towers clad with brown face brick, while the remainder of the side elevation and the rear elevation are clad with common brick. It has a gable roof covered with asphalt shingles and gable wall dormers with shaped parapets on both side elevations. The east tower has a flat roof and a shaped parapet while the west tower has a peaked roof with overhanging eaves and exposed rafters and is topped by a finial. The central bay of the front elevation has a broad, round-arched entrance with stone surround and two sets of single-light oak double-doors. The central bay also contains a strip of double-hung windows situated within a broad arch and a rose window with tracery. Fenestration on the both towers and along the side elevations comprises round-arch windows with tracery. It is unknown whether the original stained glass for all of these windows is extant inside the church. Both towers also feature paired casement windows. Window openings at the top of the west tower have been boarded-over. Detailing includes stone sills, belt courses, brick pilasters and keystones. A one-story brick-clad entrance vestibule is situated along the rear of the west elevation. Built as the First Reformed Church of Roseland, this church is recommended as individually eligible for National Register listing under Criterion A for its association with the community's once-dominant Dutch population and under Criterion C as fine example of a Romanesque Revival style church in Roseland.

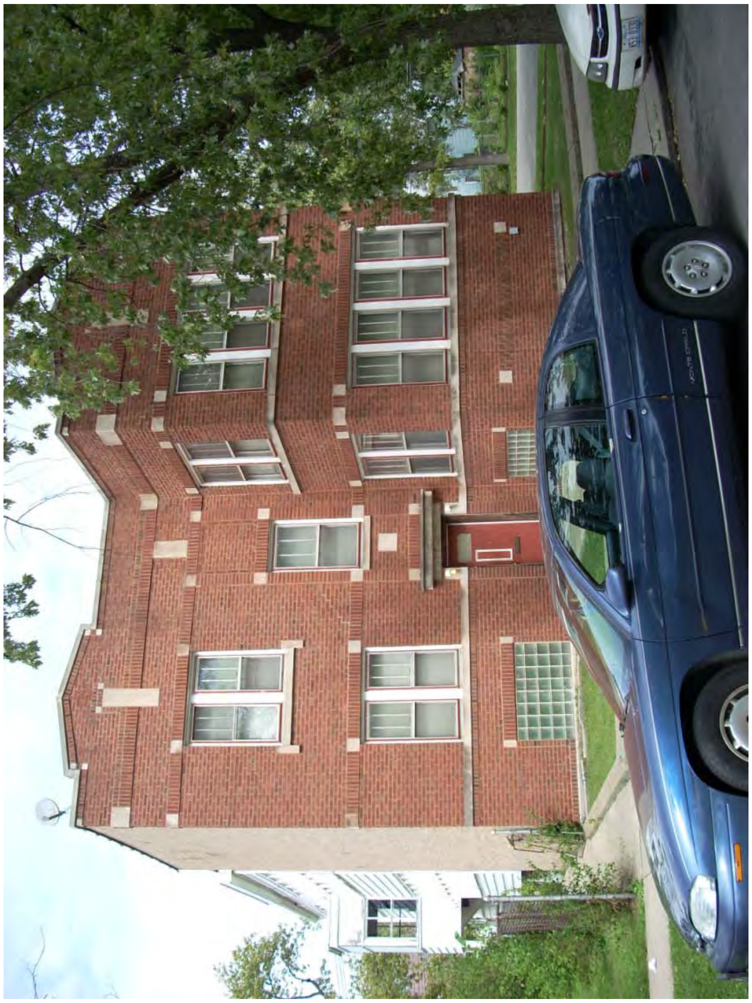
South façade of a brick, two-story, apartment building.



Property Description: **Stories:** 2

This two-story apartment building at the northwest corner of Princeton Avenue and 111th Place in the Roseland community is situated on a raised basement with glass block windows and is clad with brown face brick on its two street elevations. The building has a flat roof and shaped parapet with concrete coping. Windows are original three-over-one wood-sash windows arranged singly, in pairs, or in groups of four. The Princeton Avenue elevation also features four leaded glass casement windows. Each street elevation has an entrance with a non-original hollow core metal door. Detailing includes concrete sills and brick soldier courses with square stone inserts blocks. This building lacks sufficient distinguishing architectural features and is not individually eligible for listing on the National Register.

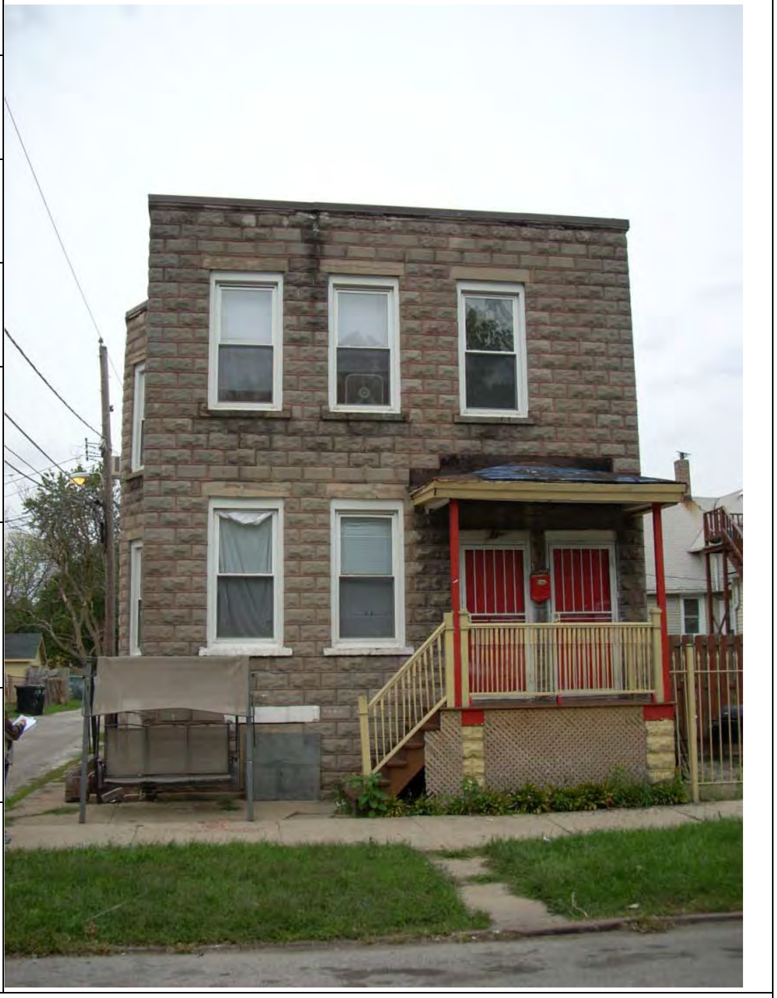
North façade of concrete block, two-flat residence.



Property Description: **Stories:** 2

This two-flat rusticated concrete block residential building in the Roseland community is situated on a raised basement. The building has a flat roof and parapet. Its front elevation has a pair of off-center hollow core metal doors, a partial-width hipped-roof wood porch with straight posts and railings, and five non-original one-over-one aluminum-sash windows: two on the first floor and three on the second. Detailing includes stone sills and lintels. The south (alley) elevation has a full-height window bay pavilion. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

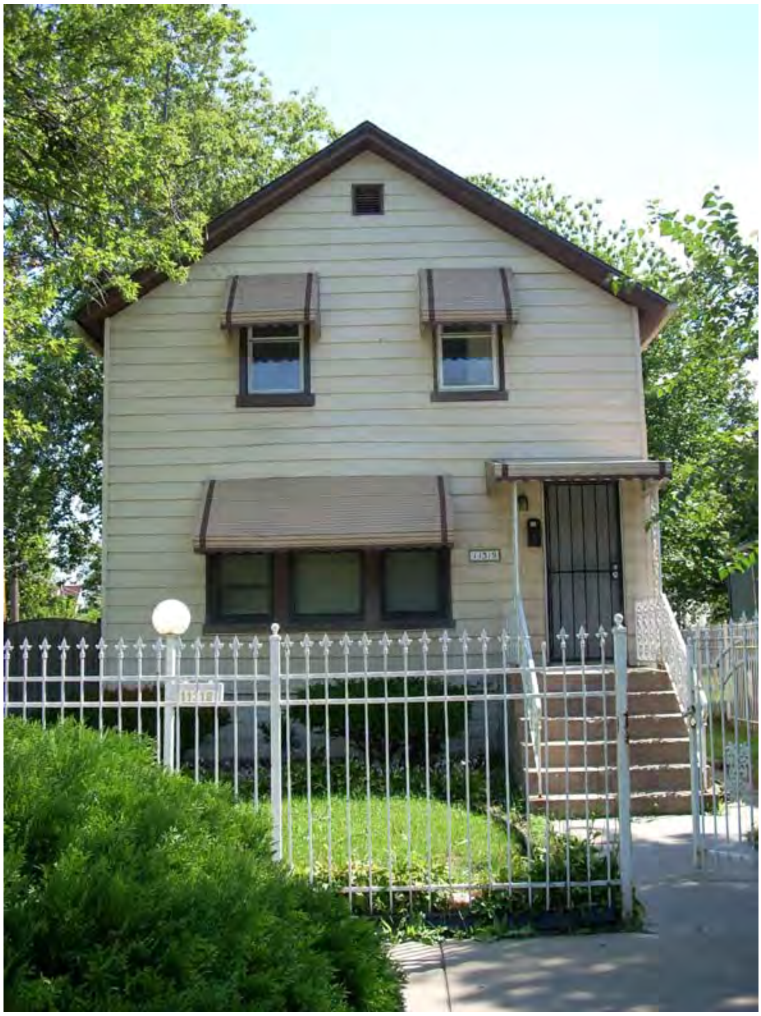
West façade two-story, single family, frame residence.



Property Description: **Stories:** 2

This two-story home in the Roseland community is clad with synthetic siding, has a gable roof covered with asphalt shingles, and is situated on a raised concrete block basement. Its front façade has an off-center, non-original, hollow metal paneled door and a porch with concrete steps, metal railings, and metal supports with a metal canopy roof. Fenestration is comprised of non-original one-over-one windows: a strip of three on the first floor and two on the second floor. One of the side elevations has a three-sided window bay on the first floor. This home lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

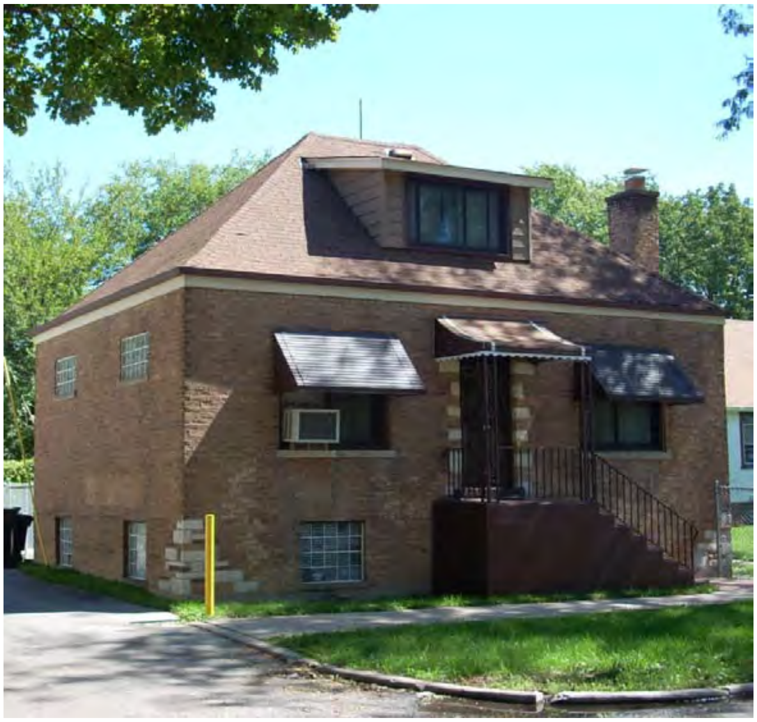
South and east façades of single family, brick residence.



Property Description: **Stories:** 1

This one-story house in the West Pullman community is situated on a raised basement with glass block windows and is clad with common brick. It has a steeply pitched hip roof covered with asphalt shingles and a shed dormer with sliding glass windows. Its front elevation features a centrally located hollow metal paneled door (non-original) flanked by paired, double-hung windows. The porch has concrete steps, metal railings and supports, and a metal canopy roof. Detailing includes rusticated stonework at the basement corners and around the door. This house does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

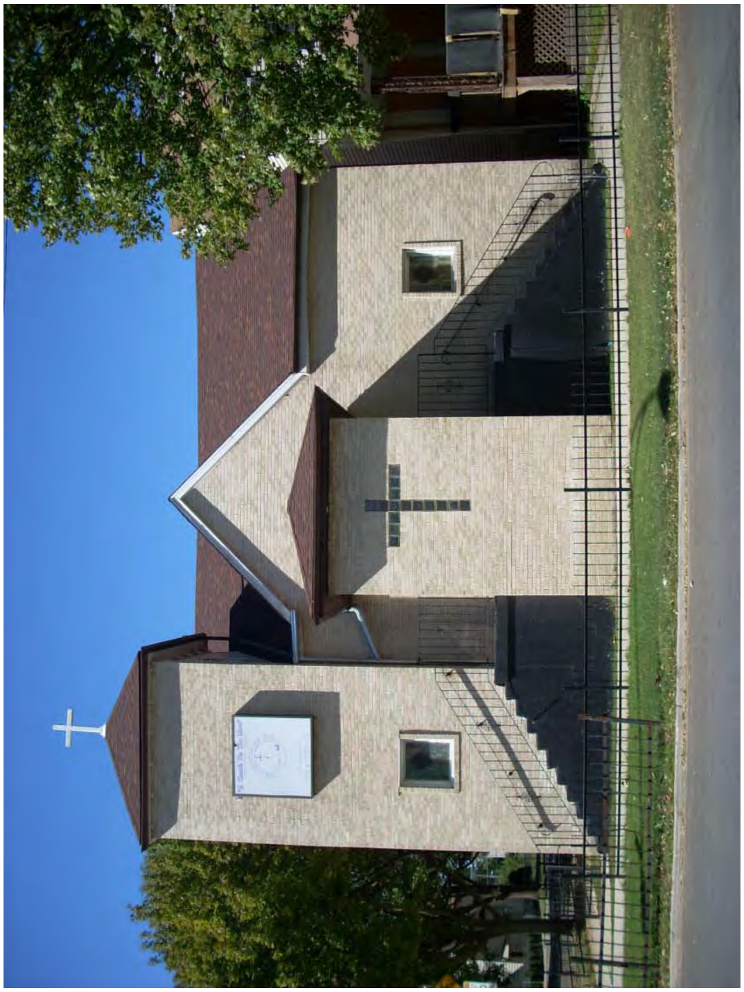
East façade of a brick, 1.5-story religious building.



Property Description: **Stories:** 1.5

This church at the corner of State and 116th streets is clad in buff face brick on a concrete block foundation. The building has a raised basement, gable roof covered with asphalt shingles, and a square corner tower with a hip roof. Its front (State Street) elevation has a centrally located hip-roof entrance pavilion with metal stairs on both sides and a gable wall dormer above. The pavilion features a cross of glass blocks and the flanking walls each have a single square leaded glass window. The side (116th Street) elevation features one large and two small pointed arch windows. This church lacks sufficient distinctive architectural features to qualify as individually eligible for listing on the National Register.

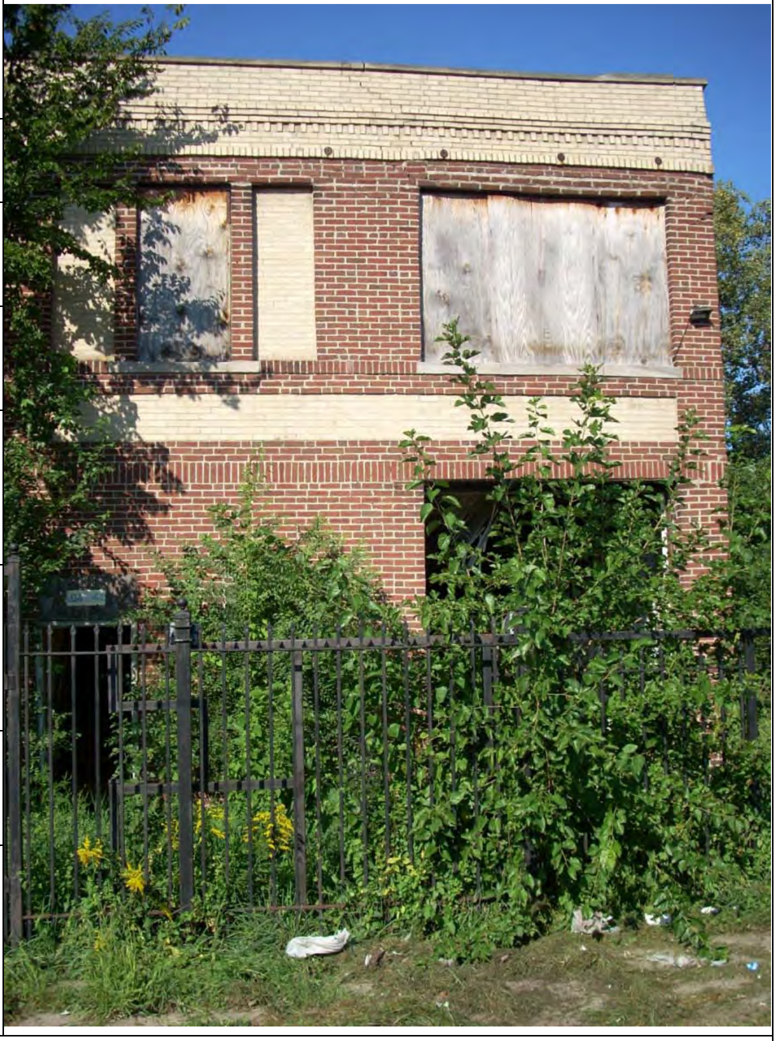
East façade two-story, brick light industrial building.



Property Description: **Stories:** 2

This two-story light industrial building is clad with face brick and common brick along its front and side elevations, respectively, and has a flat roof and parapet. The front elevation has an off-center entrance with no door, a large window opening on the first floor that is obscured by foliage, and window openings on the second floor that have been in-filled with both wood and brick. The buff brick between the first and second floors and at the parapet level contrasts with the red brick cladding of the front elevation and may be non-original. Detailing includes dentil molding on the parapet, banding in brick, and stone sills. Side elevation windows are in-filled with glass block. This building lacks integrity and architectural distinction and is not individually eligible for listing on the National Register.

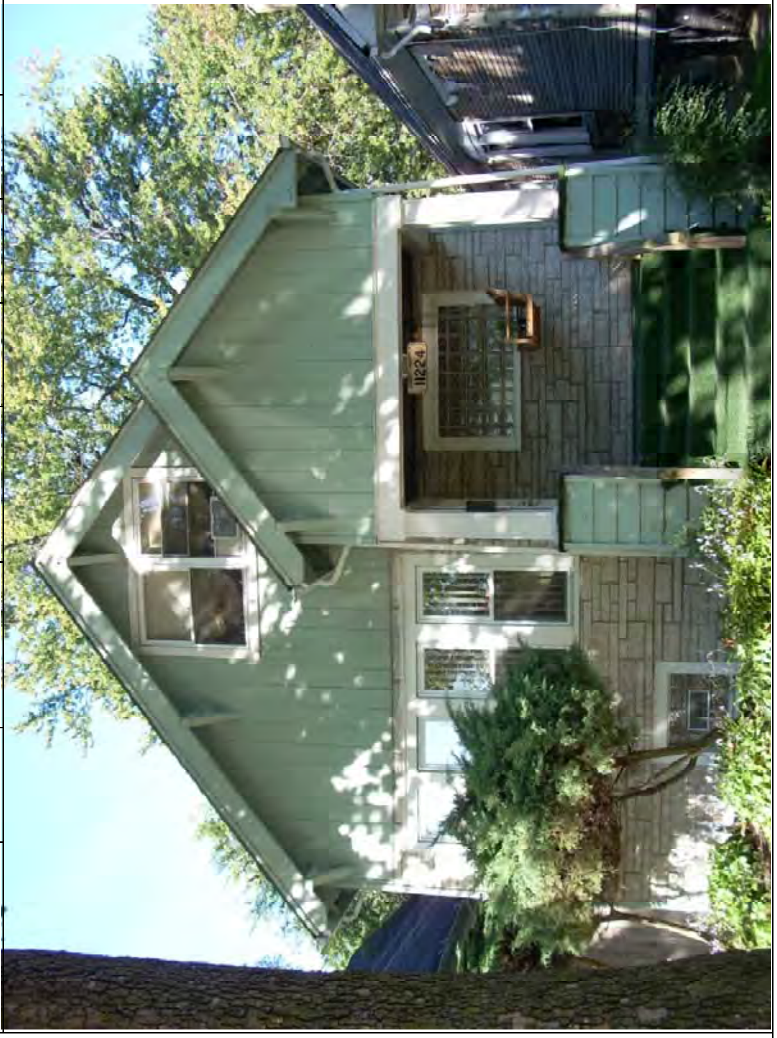
East façade of 1.5-story, frame, single family residence.



Property Description: **Stories:** 1.5

This 1.5-story house in the Roseland community is situated on a raised brick basement with glass block windows. The building has a front gable roof covered with asphalt shingles and overhanging eaves with decorative knee braces. The front elevation is covered with faux stone to the top of the first floor windows and in vertical synthetic siding above. It has a partially recessed gable-roofed corner porch with sidewalls covered with synthetic siding, two low squared wood column supports, and wood steps. A glass block window and hollow core metal door are tucked into one side of the porch. A strip of four windows on the first floor and a pair of windows in the gable are non-original one-over-one aluminum-sash. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

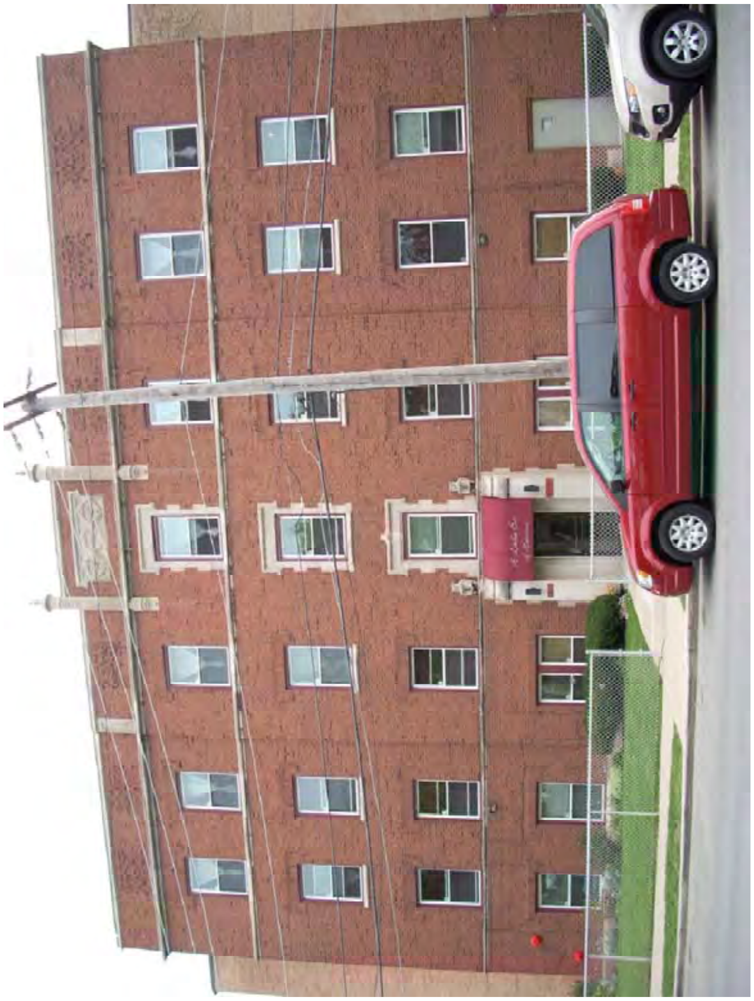
West façade of the four-story, brick building



Property Description: **Stories:** 4

This four-story building at the northeast corner of Wentworth Avenue and 113th Place in the Roseland community has a flat roof and parapet. Its symmetrical front (Wentworth Avenue) elevation is clad with brown face brick and has a centrally located entrance with a glass door and stone surround topped by two stone owls holding books. Windows are non-original one-over-one aluminum-sash; those directly above the entrance have stone casings. Detailing includes stone sills, coping, insert blocks, sill courses, cornice, panels, and pinnacles at the parapet level.

This building is recommended locally significant for National Register listing under Criterion A for Education. Formerly the Roseland Community Hospital Nurses Home, it was built by the hospital as a dormitory and educational facility for its nurses. Closely affiliated with Roseland Community Hospital, which has served as an important institution in the Roseland area since its establishment in 1924, the Nurses Home is an excellent example of this building type on Chicago's South Side. The exterior of the building has very good integrity and the interior—which now functions as a homeless shelter—appears to retain classrooms and other spaces associated with its original use.

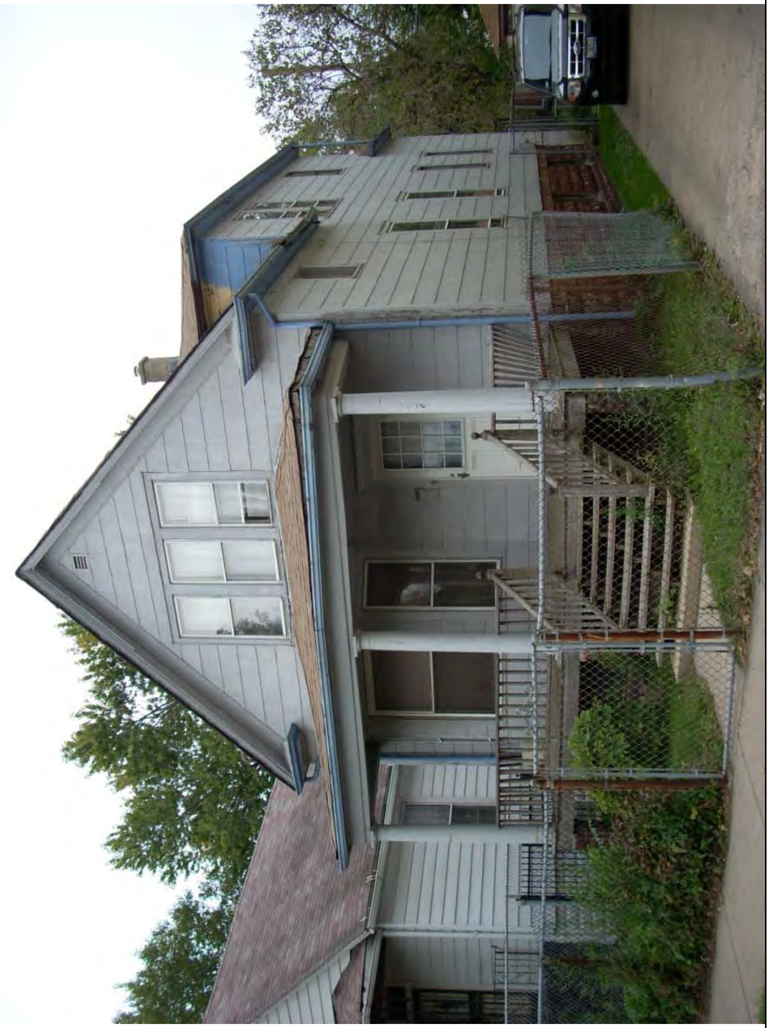
East and north façades of 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame cottage in the Roseland community is situated on a raised concrete block basement with casement windows and is covered with synthetic siding. The building has a gable roof with asphalt shingles. The front elevation has a hipped-roof wood porch with Doric columns, an off-center entrance with a hollow core metal panel door, a three-sided bay window on the first floor, and a strip of three windows in the gable. With the exception of the basement, windows are non-original one-over-one aluminum-sash. The north elevation has a hipped-roof wall dormer. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

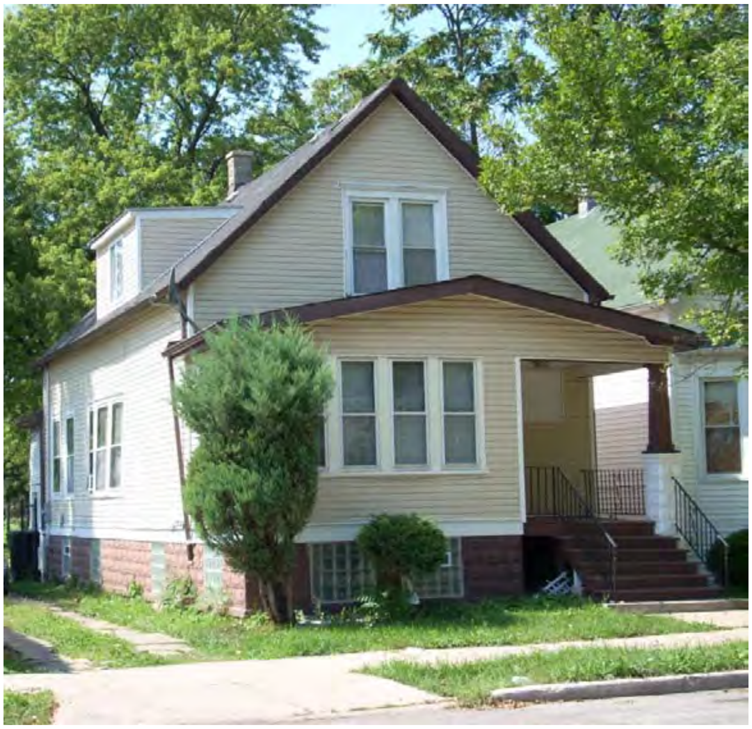
East façade of 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story home in the Roseland community is clad with synthetic siding, has a gable roof covered with asphalt shingles, has a flat-roofed dormer along one of its side elevations, and is situated on a raised concrete block basement with glass block windows. Its front elevation has a full-width gable roof porch, a portion of which is enclosed with synthetic siding and features a strip of non-original one-over-one windows. The open portion of the porch has a corner support consisting of a low faux stone pedestal topped by a wood Doric column, a window opening that has been covered, wood steps, and metal railings. A pair of non-original one-over-one windows with original wood casing is situated in the gable. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

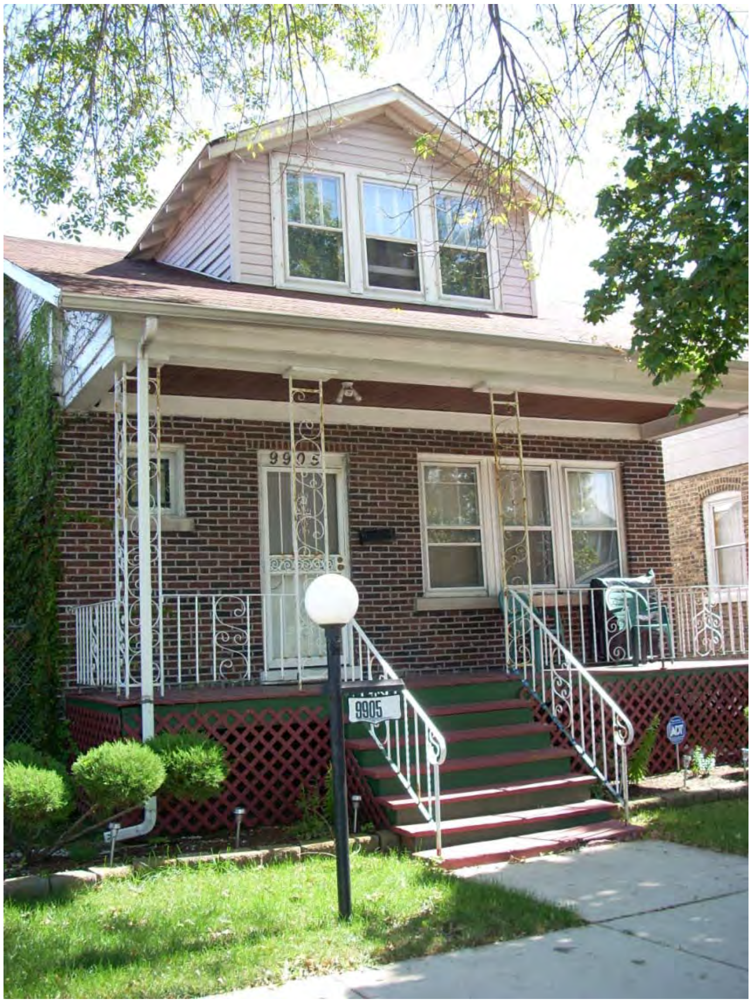
West façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story Craftsman style bungalow in the Roseland community is situated on a raised basement, is clad with brick, and has a side-gabled roof covered with asphalt shingles and overhanging eaves. Its side-gabled elevations are clad with synthetic siding, as is the gable dormer along the front elevation. The roof extends beyond the front elevation to serve as the roof of the porch, which is supported by open metal posts and has metal railings, a wooden deck, and wooden steps. The front elevation features an off-center hollow core metal door, a leaded glass casement window, and two strips of non-original double-hung aluminum-sash windows: one on the first floor and one in the dormer. This home does not feature sufficient distinguishing features to qualify as eligible for individual listing on the National Register.

Property Description: **Stories:** 1

This one-story Craftsman style bungalow in the Roseland community is situated on a raised concrete block basement and is clad with synthetic siding. It has a hip roof covered with asphalt shingles and a hip dormer with a pair of single-pane or sliding windows. Its roof overhangs to shelter the full-width wood porch with supports consisting of faux stone pedestals topped by squared wood columns. The front façade has an off-center front door, an adjacent single-pane window, and a strip of four double-hung windows. Windows appear to be original wood-sash. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story cottage in the Roseland community is situated on a raised brick basement with glass block windows and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. Its front elevation has a full-width porch with a mansard-like roof that is partially enclosed and covered with synthetic siding. This elevation of the porch also has a strip of three non-original one-over-one aluminum sash windows. The open portion of the porch has a metal storm door, concrete steps with metal railings, and an open metal corner post. A pair of non-original one-over-one aluminum-sash windows is situated in the gable. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

MEETING NOTES

RE: **Section 106 Kick-off Meeting**
Red Line Extension EIS

DATE: **October 24, 2012**

LOCATION: **Conference Call/Webinar**

TO: **Distribution and All Attendees**

ATTENDEES:

Name	**Organization**
Sonali Tandon	CTA
Reggie Arkell	FTA
Anne Haaker	IHPA (SHPO)
Jonathan Fine	Preservation Chicago
Terry Tatum	Chicago Historic Preservation Division
Lisa DiChiera	Landmarks Illinois
Erma Tranter	Friends of the Park
Helene Kornblatt	CWC Transit Group
John Mettille	CWC Transit Group
Rebecca Thompson	CWC Transit Group
Robert Ball	CWC Transit Group

PREPARED BY: Rebecca Thompson

ISSUE DATE: October 24, 2012

Meeting called to order at 1:00 pm CT

Objective: Red Link Extension Kickoff Meeting for Section 106 Consultation

Item No.	*Item Description*	*Responsibility*	*Due Date*
1	**Welcome/Intro** Sonali welcomed attendees and callers introduced themselves.		
2	**Overview of Section 106 Process** John Mettille provided an overview of the four-step Section 106 process. Reggie Arkell explained that FTA is overseeing the consultation process, working in conjunction with CTA. FTA will make determinations regarding eligibility and effects, referencing recommendations prepared by the consultant and considering input from consulting parties, including the SHPO. John discussed the roles of consulting parties and identified ground rules to ensure everyone has a fair chance to provide meaningful input.		

Item No.	*Item Description*	*Responsibility*	*Due Date*
3	**Project Info & Alternatives** Sonali provided a brief overview of the project area, the No Build alternative, and the three Build alternatives that are being considered: UPRR rail, Halsted rail, and Bus Rapid Transit. John presented the Area of Potential Effects (APE), which defines the geographic boundary where the analysis of historic resources will occur. A larger scale APE map is attached to the meeting summary.		
4	**Schedule/Next Steps** John explained the next steps in the process. Work is underway to identify potential historic properties. We are tentatively planning to hold a meeting to discuss the eligibility of resources in December. A meeting to discuss effects will occur in early 2013.		
5	**Question/Answer** - Jonathan: Is the purple segment on the alternatives map new or existing? It would be a new structure in the median of the expressway. - Reggie: What is the pier spacing for the Halsted Alternative? Spans between piers would typically be 60 to 100 feet, and as long as 140 feet. Span length would be based on site conditions, geometrics, and clearance requirements. - Jonathan: What advantages does the Halsted Alternative offer over the No Build Alternative? Halsted would extend the red line south to serve additional transit markets. The No Build Alternative includes improvements at the 95th Street station which are currently being planned but would not include an extension of the route or other improvements. - Jonathan: Which alternative has the least impacts on historic resources? That is part of what we will determine through this process. - Lisa: Is documentation of the previous study available online? Yes, the project website is http://www.transitchicago.com/redeis Please use following links to access specific materials: Locally Preferred Alternative Report and Scoping Report (http://www.transitchicago.com/Redeis/documents.aspx); Alternatives Analysis Materials (http://www.transitchicago.com/news_initiatives/planning/redextend.aspx) - Lisa: If we have additional information about resources, should we send it to the team? Yes, please direct it to Sonali at STandon@transitchicago.com. - Erma: Are parks covered in the 106 process too? Parks are protected under Section 4(f) regulation, which is a separate law; they will be addressed in the project EIS. The Section 106 process will deal with historic resources; if any parks in the area or park facilities are determined to be historic, they will be considered during the 106 process. If any historic resources are used by the project, they will be addressed under Section 4(f) as well. Parks that are not historic are subject to the 4(f).		

Please notify the author of the minutes of any corrections and/or clarifications within five (5) business days.

PREPARED BY: Rebecca Thompson

ISSUE DATE: January 31, 2013

Meeting called to order at 10:30 am CT

Objective: Red Link Extension Eligibility Meeting for Section 106 Consultation

Item No.	***Item Description***	***Responsibility***	***Due Date***
1	**Welcome/Intro** Sonali welcomed attendees. Reggie Arkell explained FTA's oversight role on the project. John Mettille reviewed the agenda.		
2	**Background & Regulations** John Mettille provided an overview of the four-step Section 106 process, which is intended to assess historic resources and their eligibility for listing on the National Register of Historic Places (NRHP). John identified ground rules to ensure everyone has a fair chance to provide meaningful input.		
3	**Review of Area of Potential Effects (APE)** John presented the APE, which defines the geographic boundary where the analysis of historic resources will occur. The area includes over 1,400 acres and 7,000 buildings.		
4	**Methodology for Identification of Historic Properties** The team developed historic contexts for each community in the APE to frame the evaluation of historic properties. The team also conducted field surveys and archival research for over 500 individual properties within the APE. The survey sample included all buildings that would be demolished by one or more alternatives and a sample of other properties; sample properties were concentrated in areas that are likely to experience greater effects. Based on this, eligibility recommendations were developed for individual properties. - Q: Did you look at properties less than 50 years in age that could be significant to the community? A: We primarily examined properties over 50, but we did look for overall significant properties as well as potential historic districts. - Q: Are Chicago Historic Resources Survey (CHRS) red/orange properties shown? A: They are noted in the summary table in section 3 of the handout packet. - Q: What research was done on the social history of the area? For example, what about identifying community meeting places or locations significant in the lives of civil rights leaders? Of the 7,000 buildings in the APE, it is concerning that only 10 are identified as eligible.		

Item No.	*Item Description*	*Responsibility*	*Due Date*
	A: The team developed historic contexts for each of the communities represented in the APE but these focused primarily on the built environment. Part of the intent of the consultation process is to gather your input about what additional resources are out there, particularly from organizations more familiar with the immediately vicinity and social history. If you have information about potentially significant resources, please let us know during the comment period.		
5	**Overview of Surveyed Properties** Nine properties were recommended eligible for NRHP listing. - Residence at 444 W 100th Place - Former substation at 10227 S Halsted Street (gas & electric for the city) - Fire Department at 324 W 104th Street - Roseland Pumping Station (still in use) - Residence at 11310 S Emerald Avenue - Church at 10920 S Princeton Avenue (currently Mary Magdalena Missionary Baptist Church) - Fire Department at 931 W 120th Street - Church at 12433-12439 S Halsted Street - Venetian Hall at 133-139 E Kensington Avenue (currently used as church and shelter) *Note: the address is correct but the property lies in the West Pullman community.* In addition, Altgeld Gardens was determined NRHP eligible in 1992 independent of the project. - Q: How do you account for the fact that the community is under surveyed and underserved? Underrepresentation undercuts the intention of the project. A: The team prepared historic contexts for each community, consistent with the state of the practice. Beyond that, we rely on your input. Once you provide your comments, the team will establish a strategy to move forward. We will respond to comments received and keep you informed. - Q: Does the list of surveyed properties fully cover the area to be considered in the historic/social context? (DCP agreed that it does not.) A: The APE covers the area that could be impacted by the project; it forms the limits for our analysis. - Q: Is there a separate involvement process for Section 4(f)? A: There is a public involvement element if these resources are affected. It isn't a committee, but there is a mechanism to gather input from agencies and others. - Kensington Park along the UPRR corridor should be added to the table on slide 29. *Note: information for Fernwood Parkway was included in the table although the name was mistakenly presented as "Fernwood Park" instead. Wendell-Smith Park is presented as "Smith Playlot" in the table, consistent with the Chicago Parks Department naming convention.*	CWC	3/1

Item No.	Item Description	Responsibility	Due Date
6	**Schedule & Next Steps** John Mettille reviewed the schedule and next steps. - Q: Can you describe the effects for each eligible property? A: We will cover this in the next phase of the process, probably in Spring 2013. - Q: What is the third alternative shown? A: The Halsted Alternative was added during the scoping process to look for options to minimize the impacts on parks and other 4(f) resources. The UPRR Alternative is the locally preferred alternative; we will define a National Environmental Policy Act (NEPA) preferred alternative as part of the NEPA process. - Q: Can the UPRR alternative fall anywhere inside the APE boundary? A: No, it will follow or run adjacent to the existing UPRR alignment. The APE includes a buffer to account for visual, noise, and other indirect effects. - Q: What source did you use for the architects and construction dates? A: CHRS and the County Assessor website. - Two of the photos on slide 26 could be considered contributing within a district. There are enough “Ranchalows” that they could be considered a housing style. The team will provide a full survey map and consulting party list as requested by attendees. Materials will be revised to clarify that properties referenced in Riverdale lie in the Riverdale Community in Chicago rather than Riverdale, Illinois. Please submit written comments on the eligibility materials by February 18.	CWC/CTA	2/6

Following the morning presentation, a number of attendees participated in a driving tour of the project area. Please notify Sonali Tandon of the minutes of any corrections and/or clarifications within five (5) business days.

cc: Attendees

Red Line Extension (RLE) Summary of Eligibility Comments received from Consulting Parties and Responses from Project Team

The following paragraphs briefly summarize comments received from the consulting parties on the eligibility of historic resources for the RLE Project and corresponding responses from the project team. Under the Section 106 consultation process, CTA undertook an extensive data collection and analysis effort during Fall 2012 to identify historic resources located within the Area of Potential Effect (APE) for the three built alternatives that are under evaluation in the RLE Draft Environmental Impact Statement (EIS). This analysis culminated in recommendations regarding the potential eligibility of historic resources pursuant to the National Historic Preservation Act of 1966. These recommendations were presented to the ten consulting parties, including the Illinois Historic Preservation Agency (SHPO), during a meeting on January 30, 2013. Participants were asked to provide relevant information from their perspective that may supplement the National Register of Historic Places (NRHP) evaluations contained within the RLE Draft EIS. Written comments were received from the following six organizations:

- Anne Haaker, Illinois Historic Preservation Agency
- Jennifer Kenny, Ridge Historical Society
- Jonathan Fine, Preservation Chicago
- Lisa DiChiera, Landmarks Illinois
- Matt Cole, Neighborhood Housing Services of Chicago
- Terry Tatum, Chicago Historic Preservation Division, Department of Housing and Economic Development

Based on local knowledge and input from the consulting parties, additional analysis was undertaken regarding historic resources within the APE. The original recommendations presented in January will be revised as described below and presented in the RLE Draft EIS. In addition to the written comments received by CTA, comments from the January 30 meeting will also be incorporated into the Draft EIS to provide additional clarification. Comments and responses are presented by general topic below.

Comments requesting additional surveys:

Several comments requested that the team evaluate additional sites for NRHP eligibility. These additional sites and their evaluations are summarized below, including both individual properties (Comments #1-6) and potential districts (Comments #7-12).

1. American Ideal Cleaning Building at 10343 South Michigan Avenue
   This building falls beyond the APE boundaries.
2. Lilydale Progressive Missionary Baptist Church at 10716 South Michigan Avenue
   This building falls beyond the APE boundaries.
3. Greystone building at 11445-11447 South Michigan Avenue
   This building falls beyond the APE boundaries.
4. Entrance gate and structure at Cedar Park Cemetery at 12584 South Halsted Street
   These structures were field surveyed in February 2013 and are recommended eligible for the NRHP under Criterion C for the high quality craftsmanship and unusual stonework. A site form is attached.

5. Kensington Park
   The Park was field surveyed and, following archival research is not recommended eligible for the NRHP. Purchased by the City in 1942, Kensington Park has been updated throughout the decades and currently contains a number of contemporary recreational amenities that give it a recent appearance: a mid-twentieth century field house that is no longer in use, playground equipment, a splash pad, a paved basketball court, a horseshoe pit, and baseball fields. Although the field house is over 50 years in age, it lacks distinguishing architectural features. As a publicly-owned park, Kensington Park will be addressed in the NEPA document as a Section 4(f) resource.
6. Two-story commercial building at 11206 South Michigan Avenue
   The building was surveyed and is not recommended eligible for the NRHP due to its lack of integrity and distinguishing architectural features. The site form is included on the Eligibility CD as 11200-11206 S Michigan Avenue.

Note: A number of sources consulted during the archival research phase – including the City of Chicago GIS database, Illinois Historic Preservation Agency's HARGIS database, County Assessor Records, and others – present building addresses inconsistently. Street numbers may differ by several addresses: the church at 12433-12439 South Halsted Street is called 12427 South Halsted Street by a different agency, though both refer to the same building. To aid comparisons, the summary table notes alternate addresses for several properties when these inconsistencies were identified during the eligibility assessments.

7. Potential historic district/grouping of cast stone-faced residences on South Eggleston Avenue between 111th & 112th Streets
   Numerous buildings in this location were surveyed as part of the representative sample set, including one cast stone-faced residence on South Eggleston Avenue (11130 South Eggleston Avenue). Individually, this building was not recommended eligible for the NRHP due to its lack of integrity and distinguishing architectural features. Along South Eggleston Avenue near West 111th Street and West 112th Street, there appear to be only two cast stone-faced residences within the APE, which is not sufficient for these properties to be considered as a potential historic district or multiple property grouping.
8. Could groupings of ranchelows contribute to a future NRHP district (between 103rd St, 104th Pl, UPRR, and Princeton Ave)?
   A number of raised ranches were surveyed as part of the representative sample set; none were found to merit individual listing for the NRHP. Although the area (between 103rd St, 104th Pl, UPRR line, and Princeton Ave) contains numerous residences with similar architectural styles, massing, setbacks, and construction dates, architectural historians confirmed that these properties do not retain sufficient integrity for the NRHP as a district due to contemporary - alterations (e.g., replacement siding, porches, windows, and doors). Numerous vacant lots and recent construction, such as the post-1980 Langston Hughes Elementary School that encompasses an entire city block, disrupts the visual cohesiveness of this area.
9. Potential district of Residential Railroad Suburbs or Historic Streetcar Communities, e.g. along the Chicago & Eastern Illinois RR; the Chicago & Great Eastern RR; the Illinois Central RR 121st Street spur; or streetcars along Michigan Ave, 103rd St, 111th St, 115th St, and 119th St.
   After additional fieldwork, no cohesive groupings of historic commercial buildings or community centers were identified along the primary thoroughfares that supported streetcar lines, railroad

lines, or spurs. Therefore, the suggested areas are not recommended as a district or multiple property group.

10. Potential district/group of properties associated with the former Village of Fernwood, generally located between 90th St, 103rd St, Stewart Ave, and Morgan/Halsted Street
    As part of the original fieldwork effort, a handful of these resources were surveyed within the APE. As noted in the letter, many have integrity issues. Many of Fernwood's signature buildings are located outside the APE or have been demolished. Further, the amount of contemporary infill has compromised the historic setting of the residential suburb. Therefore, this area is not recommended as a district or multiple property group.
11. Potential district/group of historic automobile-related buildings along major thoroughfares (e.g. Halsted and Michigan Ave)
    Although a number of auto-related resources were surveyed within the APE, none exhibited sufficient historic integrity to qualify as eligible for the NRHP either individually or as a contributing resource within a multiple property group. All of the surveyed automotive service buildings exhibit contemporary alterations.
12. Chicago Georgian and Raised Ranch Historic Districts
    The Ridge Historical Society and other consulting parties suggested these styles be considered as part of the eligibility discussions for the Section 106 process. Review by architectural historians confirmed that a cluster of these properties exists along an approximately five block area on the east side of Green Street between 104th Street and 109th Street. The streetscape has a cohesive grouping of vernacular homes that is representative of residences that were constructed in the outlying areas of Chicago during the post-World War II era. Although such neighborhoods are common throughout the city, these five blocks include hipped-roof ranch homes, front-gabled cottages, and Chicago Georgian style homes with little to no contemporary infill. The residences date from the 1950s and 1960s with consistent setbacks and similar brick cladding; they appear to be well-maintained. Therefore, the portion of Green Street between 104th Street and 109th Street is recommended as eligible for the NRHP as a historic district for architecture (Criterion C).

Comments requesting reconsideration of surveyed properties:

Several comments requested that the team reconsider properties that were surveyed but recommended not eligible for NRHP listing at the January meeting. These additional properties and their evaluations are summarized below.

13. Sure-Way M.B. Church at the southwest corner of Halsted Street and 120th Street
    The building is not recommended eligible for the NRHP due to lack of integrity and because it no longer serves its original use. The site form is included on the Eligibility CD as 12000 S Halsted Street.
14. Fernwood Parkway
    Fernwood Parkway was evaluated against NRHP criteria and is recommended not eligible for NRHP listing. However, as a publicly-owned park, it will be addressed in the NEPA document as a Section 4(f) resource.
15. Roseland Auto Sales & Service at 11200 South Halsted Street
    The building is not recommended eligible for the NRHP due to its lack of integrity. The setting is compromised by contemporary infill and the exterior has been clad in modern materials. The site form is included on the Eligibility CD as 11200 S Halsted Street.

16. Bethany Reformed Church Manse at Three West 111th Place
    The building was not originally recommended eligible due to its lack of distinguishing architectural features. However, as a result of additional information provided by Ridge Historical Society, the resource is recommended eligible for the NRHP under Criterion B due to its association with Reverend Harry J. Hager (1899-1983), a pioneer in media evangelism in Chicago during the mid-twentieth century. A revised site form is attached.
17. Pridjian & Co Building at 11600 South Halsted Street
    The building is not recommended eligible due to its lack of distinguishing architectural features. While the Pridjian & Company business has been in operation for decades, the property does not reach the level of significance required by the NRHP. The site form is included on the Eligibility CD as 11600 S Halsted Street.
18. Roseland Community Hospital Nurse's Home at 11321 South Wentworth Avenue
    The building was surveyed and was not originally recommended eligible due to its lack of distinguishing architectural features. However, as a result of additional information provided by Ridge Historical Society during the eligibility discussions for the Section 106 process, the resource could be considered locally significant under Criterion A for Education based on its use as a dormitory for its nurses and as an important nurse training facility. A revised site form is attached.
19. Galloy & Van Etten Cut Stone Contractors Building at 11756 South Halsted Street
    The building was not originally recommended eligible under Criterion C due to its lack of integrity and distinguishing architectural features. However, as a result of additional information provided by Ridge Historical Society during the eligibility discussions for the Section 106 process, the resource could be considered locally significant under Criterion A for its longstanding association with the local construction industry as a 113-year old stone contracting company. A revised site form is attached.
20. Would the substation at 10227 South Halsted Street be eligible under Criterion A as well?
    Yes: the substation is recommended eligible under Criterion A for its association with utilities infrastructure within the city of Chicago. At the January 2013 meeting, it was recommended as NRHP eligible under Criterion C. A revised site form is attached indicating this building as eligible both under Criterion A and Criterion C.
21. Although noted architect Murray Hetherington designed the house at 11001 S Green Street, the resource was only evaluated based on its integrity.
    Numerous residences designed by Hetherington that exhibit greater integrity exist today, including 2078 West Hopkins Place, 8918 South Hamilton Avenue, and 8929 South Hamilton Avenue. Due to the compromised integrity of the Green Street property, it is not recommended as NRHP eligible. The site form is included on the Eligibility CD as 11001 S Green St.

Comments regarding assessment of effects:

The following comments expressed concern about the assessment of effects, which will be covered in the next phase of the consultation process. Noted below, these will be considered in the next phase of the analysis.

22. We object to historic properties being purchased and demolished for construction staging.
23. The proposed BRT route would affect the fewest cultural resources. The UPRR route will affect fewer resources than the proposed Halsted line.

24. Building an elevated rail line down Halsted Street would have negative consequences for the tranquil and bucolic atmosphere of the Cedar Park Cemetery.

Comments requesting minor amendments to the summary table and/or site forms:
The following comments identified minor amendments to the summary table and/or site forms for individual properties. None of these modifications change the NRHP eligibility recommendations. Noted below, these edits will be incorporated; revised materials will be provided along with the effects materials prior to the next phase of the consultation process.

25. The Fire Department Engine Co. 93 building at 324 West 104th Street (alternate address: 328-330 W. 104th St.) is CHRS Orange
26. The Roseland Pumping Station at 351 West 104th Street is CHRS Orange
27. The French Eclectic style house at 11310 South Emerald Avenue was listed as a “local landmark” but is not designated; it is CHRS Orange.
28. The Romanesque Revival style Church at 10920 South Princeton Street is CHRS Orange
29. The two-story commercial building at 11206 South Michigan Avenue is CHRS Orange
30. The architectural firm of Fox & Fox designed the church at 12433-1439 South Halsted Street, which was built in 1958-1959.
31. The Venetian Hall at 133-139 East Kensington Avenue was built in 1925-1926 and designed by Arthur F Hughes.
32. The house at 11310 South Emerald Avenue was built 1927-1928 for Stuart Colman. Inventory form should specify this resource is individually eligible.
33. Property listed as 748 East 103rd Street should be 748 West 103rd Street.
34. The substation at 10227 South Halsted Street was built in 1919-1920.

Other Comments:
Additional comments received are discussed below.

35. There should be a separate category in the spreadsheet for Chicago properties rated as “orange” on the Chicago Historic Resources Survey (CHRS).
    CHRS Orange properties were noted in the summary table provided to consulting parties on January 5, 2013. These properties will be discussed separately within the project’s Environmental Impact Statement.
36. We [SHPO] generally concur with the findings of the architectural surveys. It is expected that additional resources suggested will be considered once the final route is selected.
    Comment noted.
37. While we agree that the house at 444 West 100th Place is NRHP eligible, we disagree about the Neo-Traditional style description and are concerned that the replacement of the original tile roof jeopardizes integrity.
    Based on the ornamentation (Neo-Gothic castellated porch roof, Classical colonettes, and arched lintels), the house was identified as an early example of the Neo-Traditional style. It is recommended as NRHP eligible and will be assessed for effects in the next phase of the consultation process.
38. Use of catch-all architectural style descriptors was inconsistent and difficult to sort/review.
    Many of the residential resources are stripped-down brick and frame bungalows and cottages representing the predominant building stock for the study area. Likewise, commercial resources

contain little ornamentation or detailing. The broad term “vernacular” was used whenever a resource did not exhibit a particular architectural style. This approach is consistent with the current state-of-the-practice.

39. Historic functions should match NRHP categories.
    While official NRHP functions were not used on the survey forms, easily identifiable equivalent terms were used to improve comprehension for a broader audience. This approach is consistent with the current state-of-the-practice.
40. Construction dates listed in the Cook County Assessor Records are less reliable than dates listed in building permit records.
    Numerous varied sources were used to establish and cross-check construction dates: County Assessor records, GIS database layers provided by the City of Chicago, the HARGIS database maintained by the Illinois Historic Preservation Agency, Sanborn mapping, etc. This approach is consistent with the current state-of-the-practice.
41. The church at 10920 South Princeton Avenue is currently called Mary Magdalene Missionary Baptist Church.
    The church at 10920 South Princeton Avenue was identified by both its historic name (First Christian Reform Church of Roseland) and its current name (Mary Magdalene Missionary Baptist Church) on the inventory form. The property is eligible for the NRHP due in part to its association with early Dutch settlement in the area, so the historic name was referenced in the presentation.

CTA
Red Line Extension

February 4, 2013

Sonali Tandon
Chicago Transit Authority
567 W. Lake St.
Chicago, IL 60661-1498

Dear Ms. Tandon:

Thank you for requesting comments from our office concerning the possible effects of the referenced project on cultural resources. Our comments are required by Section 106 of the National Historic Preservation Act of 1966, as amended, and its implementing regulations, 36 CFR 800: "Protection of Historic Properties".

We appreciated information provided during the meeting at the CTA on January 30, 2013, and the tour that augmented the architectural surveys and introduced the three routes proposed by the CTA. In general we concur with the findings of the architectural surveys submitted to this office prior to the meeting and tour, but during the tour is was noted that resources identified on the Chicago Historic Resources Survey were not identified and that structures such as those located within Cedar Park Cemetery were excluded from the sample. It is likely that our preservation partners present at the meeting will have additional resources that they would like to see included in the survey. It is expected that these additional resources will be considered once a final route has been selected.

In our opinion, the proposed expansion of the BRT route will affect the least amount of cultural resources located within its APE. We also believe the UPRR route that is often adjacent to existing railroad tracks will affect fewer resources than the line proposed on Halsted Street.

We look forward to reviewing the final historic resources report once the comments of our preservation partners have been considered.

If you have questions please contact David J. Halpin, Cultural Resources Manger, at 217-785-4998.

Sincerely,

Anne E. Haaker

Subject: Red LIne Extension Section 106 - comments on historic resource identification

Dear Ms. Tandon:

Thank you for the opportunity to comment on historic resource identification efforts for the Red Line Extension Project as part of the ongoing Section 106 consultation process for this project. Our office appreciates the scale and importance of this undertaking, and we commend the CTA’s efforts to incorporate historic preservation issues and concerns into its larger planning efforts. We hope to work with you to minimize the effect of the Red Line Extension Project on historic properties.

As part of the Section 106 process, we wish to bring to your attention both general observations on this historic resource identification effort, as well as comments on specific properties that may be impacted by the project.

Chicago Historic Resources Survey red- and orange-rated properties

With the help of your consultant team, you have preliminarily identified properties that are eligible for NR listing. These properties have been listed in the “RLE Draft Eligibility Findings for Surveyed Properties” spreadsheet.

Our office believes that there should be a separate category in the spreadsheet for Chicago properties rated as “orange” on the Chicago Historic Resources Survey. (There are no CHRS “red-rated” buildings in the Red Line Extension’s APEs.) Conducted between 1983 and 1995, this city-wide survey identified properties constructed prior to 1940 that were perceived to have, within at least the context of their neighborhoods, some historic significance to these neighborhoods. These buildings were either color-coded red or orange, depending upon the level of their historical and architectural significance as known at the time of the survey.

Although not designated Chicago Landmarks, these CHRS “red” and “orange”-rated properties are covered by the City’s Demolition-Delay Ordinance, enacted by City Council in 2003, which allows for an up-to-90-day hold on building permit applications for demolition by the Department of Housing and Economic Development (DHED) for these properties. (More information on this ordinance can be found at http://www.cityofchicago.org/city/en/depts/dcd/supp_info/demolition_delay.html.) Even where such properties have also been determined eligible for National Register listing, we believe that it is prudent of the CTA to separately identify all CHRS orange-rated properties within the APEs on the historic resources spreadsheet. The effect of the Red Line Extension Project on these “orange” properties can then be determined and, if necessary, mitigated through direct discussions with DHED as early in the project as possible.

Observations concerning individual properties located in the APEs

1. Several buildings identified as “orange-rated” in the Chicago Historic Resources Survey (CHRS) were sampled by the CTA’s historic resources consultants.

The **Classical Revival substation** at 10227 S. Halsted St. (Map 7) was determined eligible for National Register listing. It is a CHRS "orange-rated" building and was noted as such on the spreadsheet.

The **Fire Department Engine Co. 93 building** at 324 W. 104th St. (alternate: 328-330 W. 104th St.) (Map 30) was preliminarily determined eligible for National Register listing. It is a CHRS "orange-rated" building, but was not noted as such on the spreadsheet. It should be so noted.

The **Roseland Pumping Station** at 351 W. 104th St. (Map 30) was preliminarily determined eligible for National Register listing. It is a CHRS "orange-rated" building, but was not noted as such on the spreadsheet. It should be so noted.

The **French Eclectic style house** at 11310 S. Emerald Ave. (Map 12) was listed as a "local landmark" and preliminarily determined eligible of NR listing. However, it is not a designated Chicago Landmark. Instead, it is an "orange-rated" building in the CHRS, but was not noted as such on the spreadsheet It should be so noted.

The **Romanesque Revival style Church** at 10920 S. Princeton St. (Map 34) was preliminarily determined eligible for National Register listing. It is a CHRS "orange-rated" building, but was not noted as such on the spreadsheet. It should be so noted.

2. In addition, one building identified as "orange-rated" on the CHRS and located within the APE for the BRT option was not identified and sampled. The **two-story commercial building** at 11206 S. Michigan Ave. (listed as 11208 S. Michigan on Map 45) was not sampled by the historic resource survey. It is an "orange-rated" building in the CHRS (CHRS data form and Google Earth photo attached) and should be noted as such on the spreadsheet. It should also be separately evaluated for National Register eligibility.

I would be pleased to assist the CTA's consultant team as they gather additional information on historic resources within the APEs for this project.

Sincerely,

Terry

RE: Red Line Extension– NR eligible properties in APE

Dear Ms. Tandon,

As requested, we have reviewed the APE boundaries and the properties identified within the APE that are listed in or "eligible" for listing in the National Register of Historic Places by the Red Line Extension project team.

We are very pleased to see the numerous properties identified and acknowledged as historic. However we have the following observations:

- We recommend including all properties that are orange-rated in the Chicago Historic Resources Survey (CHRS) in a separate category due to the fact that they will require an additional mitigation process through the city's demolition delay ordinance.
- During the driving tour of the preferred Red Line Extension routes, I took note of the following properties that were not included in the project team's list of eligible properties that looked as if they could be of possible architectural significance.
    - The American Ideal Cleaning Building at 10343 S. Michigan – a mid-century commercial building
    - The Lilydale Progressive M.B. Church at 10716 S. Michigan
    - City Sports store commercial block at 11102 S. Michigan
    - 11445-47 S. Michigan – Commercial/residential side by side Greystone – rated orange in CHRS
    - 11451 S. Michigan – one story commercial Art Deco building – rated orange in CHRS
    - Sure-Way Missionary Baptist Church at S.W. corner of Halsted and 120th. Art Deco corner building with a mid-century addition on the south side
    - Entrance gates and structure to Cedar Park Cemetery, 12584 S. Halsted
- Based on precedent with the Brown Line renovation project, we object to historic properties being purchased and demolished to make way for construction staging. We hope the team will specifically identify historic properties in the areas where construction staging may be planned to help identify alternative locations.

Thank you for the opportunity to review the findings by your team for this project. Please let me know if we can be of further assistance before the next consultation.

Sincerely,

Lisa DiChiera

RE: Red Line Extension – National Register eligible properties in APE

Dear Ms. Tandon,

As a housing and community development organization with longstanding ties to the greater Roseland area, we appreciate CTA inviting Neighborhood Housing Services of Chicago, Inc. (NHS) to participate in the Section 106 review for the proposed Red Line Extension routes. NHS believes the Red Line Extension project will ultimately enhance the livability and well-being of Roseland and surrounding neighborhoods by increasing transit access for residents. At the same time, we wish to ensure that the project minimizes any undue impacts on the existing residential, community, and historic buildings that make these neighborhoods great and that our experience has shown can be important community-building and engagement assets. Therefore, NHS would like to submit the following comments regarding the National Register eligible properties surveyed by the Red Line Extension project team in the APE:

- We recommend re-evaluating the exclusion of raised ranches – colloquially referred to "ranchelows" for looking like a cross between a Chicago bungalow and a ranch-style home – from the survey. While currently not a formally recognized form of Chicago vernacular architecture, these homes define the look and character of large stretches of the APE adjacent to UPRR right-of-way. We would encourage the CTA project team to determine if groupings of "ranchelows" in the APE could contribute to a future National Register district.
- During the van tour of the preferred Red Line Extension routes on January 30th, we also took note of the following areas that warrant additional surveying/review by the project team:
  - 111th & 112th South Eggleston: A few cast stone-faced residences were observed on or adjacent to these blocks, including one home immediately adjacent to the UPRR right-of-way. These buildings, which look similar to Chicago greystones, are relatively rare and should be evaluated for National Register eligibility.
  - 103rd Street to 104th Place between the UPRR and Princeton Avenue: This area includes the previously identified, National Register-eligible Roseland Pumping Station and Roseland Fire Station properties. However, the blocks also include a largely intact and well-maintained grouping of Chicago bungalows and frame

cottages. We would encourage the project team to conduct a more detailed survey of these blocks to determine if these residential properties could contribute to a future National Register district.

- Though not directly applicable to the survey of National Register-eligible properties, we encourage the project team to carefully evaluate the potential impact of the Red Line Extension on the Fernwood Parkway that runs immediately west of the existing UPRR right-of-way. Albeit simply landscaped, the parkway provides a nice amenity to homes along Eggleston Avneue between 99th and 104th Streets.

In addition to these observations, we fully concur with the recommendations from Lisa DiChiera, Director of Advocacy, at Landmarks Illinois regarding specifically calling out "orange-rated" properties listed on the Chicago Historic Resources Survey; the additional commercial, religious, and community buildings that should be evaluated on Michigan Avenue and Halsted Street; and avoiding the demolition of any historic properties to make way for construction staging.

Thank you again for inviting NHS to participate in the Section 106 review for the Red Line Extension project. Please let us know if we can be of further assistance before the next scheduled consultation.

Best,

Re: Red Line Extension – Possible negative effects to historic properties with in the proposed APE

Dear Ms. Tandon,

Thank you for facilitating the recent driving tour of the three proposed routes for the Red Line extension. I am writing in response to concerns our organization has regarding possible destruction of historic buildings or landscapes with the APE.

I have had a chance to review the comments being submitted by Landmarks Illinois and we agree with and support all of their concerns.

In addition, we are concerned about the negative consequences that building an elevated rail line down the middle of South Halsted Street would have on the tranquil and bucolic atmosphere of Cedar Park Cemetery.

Thank you for your consideration. We look forward to continuing our partnership on this exciting project.

Sincerely,

Jonathan Fine

February 20, 2013

Sonali Tandon
Chicago Transit Authority
567 West Lake Street, 10th Floor
Chicago, IL 60661

Dear Sonali,

Thanks for the opportunity to be a consulting party to the CTA's Red Line Extension (RLE) Section 106 eligibility process.

The Ridge Historical Society (RHS) serves the Beverly, Morgan Park and Washington Heights community areas on Chicago's south side. For this reason, we are particularly interested in the RLE impact upon historic properties in the APE situated within the Morgan Park and Washington Heights community areas. Both the Halsted Street and Union Pacific Railroad APE are located at the easternmost boundary of our service area. Please note that we do maintain an archival collection that reaches beyond our service area since our history does overlap with nearby areas, including West Pullman and Roseland. We reserve the right to comment on historic resources in other community areas just outside of our service area.

I have reviewed the materials and inventory forms submitted by the consulting team and offer the following comments.

IDENTIFIED NR ELIGIBLE PROPERTIES

The Ridge Historical Society agrees with the National Register (NR) eligibility of the two properties identified by the study in the Washington Heights community areas (our service area) – 10227 S. Halsted Street and 444 West 100th Place. Unfortunately, the team did not identify any NR eligible properties in the Morgan Park community area.

1. We agree that the City of Chicago Department of Gas and Electricity, Southwest Substation, at **10227 South Halsted Street** is NR eligible under C for its architecture, as a rare remaining example of a city government public works building. As stated on the study's inventory form, it is an orange rated building in the Chicago Historic Resource Survey (CHRS). The CHRS did supply a date of construction, 1919-20, that does not appear on the inventory form. I am wondering if this public works building is also NR eligible under A.
2. We agree that the single family dwelling at **444 West 100th Place**, built 1931, is potentially NR eligible under C for its architecture, as a rare brick Bungalow in

Washington Heights with striking Tudor Revival and Mediterranean Revival detailing. The Bungalow sports a handsome crenellated entry, decorative arches, and colonettes. I would not call this building Neo-Traditional, which is an architectural style reserved for late 20th-century buildings. I am concerned that this home once had a clay tile roof, perhaps jeopardizing its integrity. A similar house, designed by architect John Hoche, can be found in Beverly at 1762 W. 94th Street.

Additionally, I am providing architectural and historic info on other properties in the APE flagged as NR eligible by the team:

- The architectural firm of Fox and Fox designed S. S. Peter and Paul Church, **12433-12439 S. Halsted Street**, 1958-59. Architect John J. Fox, Jr. was a longtime resident of Beverly-Morgan Park and a noted local Roman Catholic church designer. He died in 2003.
- Venetian Hall, **133-139 E. Kensington Avenue**, was built in 1925-26 and designed by architect Arthur F. Hughes. Hughes is a local architect who designed a number of striking historic revival style homes in Beverly-Morgan Park.
- **11310 South Emerald Avenue** was built in 1927-28 for owner Stuart Colman. Note: the Individually Eligible category on page 2 of the inventory form says No when it should say Yes.

ADDITIONAL INDIVIDUAL PROPERTIES THAT MAY BE POTENTIALLY ELIGIBLE FOR THE NATIONAL REGISTER OF HISTORIC PLACES

The Ridge Historical Society would like the team to consider the following buildings for NR eligibility:

Roseland Auto Sales and Service Building (Allinone Auto Sales Building)
11200 South Halsted Street (Morgan Park)
Built 1927 for Henry T. Vollmer
Doerr, Lindquist and Doerr, architects

Potentially eligible under Criterion C for architecture as a rare remaining example of a garage and auto sales building from the early 20th-century in Morgan Park. Both Beverly-Morgan Park and Roseland were once major centers of auto sales on Chicago's south side, with dealerships along major area thoroughfares. Building is best known historically as a satellite salesroom for Roseland Auto Sales, featuring Studebakers. Additionally, Midland Terra Cotta Company provided the handsome terra cotta ornament for the one-story brick store building. Its integrity was likely questioned by its wood paneled storefront, but the original storefront may be behind the vertical boards If not individually eligible, perhaps eligible as part of a multiple property listing (see below).

Bethany Reformed Church Manse
3 West 111th Place
Craftsman-style single family residence
Built 1923-24
Purchased by church and addition built in 1928

Potentially eligible under criterion B for its historic associations with Reverend Harry J. Hager, pastor of Bethany Reformed Church from 1929-1975. Hager was a pioneer in media evangelism in Chicago during the mid 20th-century through his Sunday radio ministry broadcasts on local stations WHIP and WCFL. This church-related residence in the Craftsman style retains a high degree of architectural integrity, including a Gothic Revival style entry porch that likely dates to Hager's residency.

K. A. Pridjian and Company Building
11600 South Halsted Street
Built 1960

Potentially eligible under Criterion A for its historic associations with longtime local business, K. A. Pridjian and Company, Rug Cleaning and Sales. Established in 1924 in Roseland, Pridjian first operated at 54 West 111th Street. Owner K. A. Pridjian (d. May 6, 1965) had the facility built specially for his rug operation. Building retains much of its integrity in its mid-century storefront design, materials, and signage. (side note: Almost everyone in Beverly-Morgan Park has their rugs cleaned by Pridjian!)

Roseland Community Hospital Nurses Home
11321 South Wentworth Avenue
Built 1923-24
E. Hall, architect.

Potentially eligible under Criterion C for its architecture as a rare remaining example of a unique education-related building type in Chicago, a hospital-affiliated nurses' home. The three-story brick, Roseland Community Hospital Nurses' Home provided housing and educational opportunities for women training in the nursing profession. The interior may still reflect dormitory rooms, classrooms, and other spaces essential for nurses' training during the early 20th-century. Not sure how many of these building types are left in Chicago, but might be one of the only on the south side.

Galloy and Van Etten Cut Stone Contractors Building
11756 South Halsted Street
Built over time – 1921, 1928, 1946 and 1950

Potentially eligible under Criteria C for its associations with the Van Etten family, prominent local builders on Chicago's south side. Galloy and Van Etten, a longtime cut stone contracting business near the Panhandle railroad tracks, has operated continuously at this site from at least 1909. The cut stone exterior of the buildings within the complex reflects its occupant's trade. Founder Abe Van Etten was the brother of Simon and Henry Van Etten, whose contracting firm known as Van Etten Brothers built monumental residences and religious buildings on the south side. Galloy and Van Etten likely provided the cut stone used in many of these buildings.

NR ELIGIBLE CONTIGUOUS HISTORIC DISTRICTS OR MULTIPLE PROPERTIES

The Ridge Historical Society urges the team to revisit any groupings of historic properties that may be potentially NR eligible as contiguous districts or as multiple property listings The APE is located in a section on Chicago's south side that has been under surveyed in the past, and as a result, little data is available and very few historic resources have been proactively designated as local landmarks or listed in the National Register of Historic Places. Perhaps our community areas need a different approach in this type of study, especially when conducting cultural resource surveys. For example, surveyors could relax harsh integrity standards or look at broader patterns that might lead to multiple property nominations.

Here are some suggestions:

1. Would any of the Historic Residential Railroad Suburbs or Historic Streetcar Communities in the APE be NR eligible as multiple property listings? Since suburban development was extensive outside of nineteenth-century Chicago, perhaps the team could take a second look at the communities that were stimulated and developed along the area's railroads and streetcars in 19th-century Calumet Township and Chicago's early 20th-century neighborhoods. Especially important are those along the Chicago and Eastern Illinois, which came through in 1880-81 (UPRR APE); the Chicago and Great Eastern Railroad, an early subsidiary of the Pittsburgh, Cleveland, Chicago and St. Louis Railway who constructed tracks in 1865 (Halsted APE); and the Illinois Central Railroad who operated an east-west spur at 121st Street. Streetcars were operating along Michigan Avenue, 103rd Street, 111th Street, 115th Street and 119th Street, and stimulating residential and commercial development.

   Properties Associated with the former suburban Village of Fernwood. Fernwood is now part of the Washington Heights community area and within the RHS service area.

   Fernwood, a station stop on the Chicago and Eastern Indiana Railroad was first incorporated as a village in 1886 and annexed to the City of Chicago in Spring of 1891. Focused on a station at the 103rd Street crossing (then Tracy Avenue), Fernwood was mostly a residential district, with a few locally serving commercial buildings. Its boundaries ran from 90th Street on the north, 103rd Street on the south, Stewart Avenue on the East, and Morgan and Halsted on the west. Developers E. L. Gillette and Henry L. Hill, along with S. Montgomery Smith, laid out Fernwood in 1883 for residential development with an adjacent public park, approximately 75 feet wide along the tracks from 99th Street to 103rd Street. This park, now known as Fernwood Parkway, played a significant role in the development of this railroad suburb. This landscape feature marks the importance of open space, trees, and grassy public space to a growing residential suburb. Within the APE, a number of frame homes on suburban size lots remain, particularly along Eggleston Avenue, representing this period of development. Yet, these residences may have integrity issues (see 10100 South Eggleston Avenue), and many of Fernwood's signature buildings are either outside of the APE (including churches and a public school) or have been demolished (such as the Fernwood Station and Gillette Hall).

2. **Historic automobile-related buildings along major thoroughfares, including service stations, garages and car sales dealerships**. In reviewing the inventory forms in the APE, the team recorded a large number of auto-related buildings, although not contiguous. Halsted Street and Michigan Avenue were both major thoroughfares for the area, and as stated above, both Beverly-Morgan Park and Roseland were once major centers of auto sales on Chicago's south side. Could these buildings be NR eligible as a multiple property nomination?

3. **Chicago Georgian and Raised Ranch Historic Districts**. Just like the Chicago Bungalow Multiple Property Listing and subsequent NR districts, perhaps a multiple property listing is imminent for neighborhoods of Chicago Georgians and Raised Ranches. Both are mid 20th-century vernacular types which evolved from the earlier designs and plans of the American Foursquare and Bungalow respectively. Rows of raised ranches (also known as Bungalow Ranches) are found in the Halsted APE.

GENERAL COMMENTS AND CORRECTIONS:

1. Usage of catch-all architectural styles and types. Most every building I reviewed was labeled vernacular. Architectural styles, when used, were inconsistent. Using catch all categories makes it quite difficult to sort, review and compare important architectural specimens. Upon request, I can provide corrections to architectural styles and types in the Washington Heights and Morgan Park community areas.
2. Historic and current functions and uses should match National Register categories.
3. Construction dates for historic buildings in the APE came from an unreliable source– Cook County Assessor lists. A better primary source, such as City of Chicago building permit records, should be used for those properties determined NR eligible. It is disappointing that the team did not conduct basic research on the very small number of buildings (9) determined eligible in the study under NR Criterion C for architecture. Construction dates, owners, architects and builders would surely add to the historic context and story.

4. 748 E. 103rd Street (Washington Heights) should be **748 W. 103rd Street**.
5. Noted Beverly-Morgan Park architect Murray Hetherington designed the Tudor Revival-style residence at **11001 South Green Street** (Morgan Park), built 1940-41. Although a handsome, small scale Tudor Revival house, strict integrity standards were applied by the team.

Please contact me with further questions.

Sincerely,

Jennifer R. Kenny

Robert Ball	CWC Transit Group
Virginia Jackson	CWC Transit Group
Erika Sellke	Chicago Park District
Sylvia Jones	Friends of the Parks
Maria Stone	Friends of the Parks

PREPARED BY: Rebecca Thompson

ISSUE DATE: June 6, 2014

Meeting called to order at 10:00 am CT

Objective: Red Line Extension Effects Meeting for Section 106 Consultation

Item No.	*Item Description*
1	**Welcome/Intro** Mike Connelly welcomed attendees. JM reviewed the agenda and informed attendees that a public Open House is scheduled for May 13.
2	**Review of Project and Previous Section 106 Tasks** ST explained the overall purpose of the project and alternatives. JM provided an overview of the four-step Section 106 process, which is intended to assess project effects on historic resources (those previously identified as eligible for National Register of Historic Places [NRHP] listing). JM identified ground rules and reviewed previous coordination efforts undertaken to date as part of the Project. In response to comments received after the eligibility consultation in January 2013, Kensington Park was surveyed but was not recommended as eligible. Six potential historic districts were suggested; Green Street is recommended as eligible. Nine individual resources were suggested for reconsiderations. Of these, four resources are recommended as eligible based on supplemental information.
3	**Overview of Alternatives** JM presented an overview of the four alternatives that will be evaluated in the EIS: No Action, Bus Rapid Transit (BRT) along Michigan Avenue, the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Rail Alternative. - Q: Is the BRT park-and-ride lot on the north side of 130th Street? A: Yes. - Q: Why are the garages shown as three levels? As shown, it looks like a huge impact on Altgeld Gardens. A: Preliminary ridership analysis indicates park-and-ride demand, which is why we are proposing such large structures. As we fine tune the design moving forward, we'll re-evaluate the garage sizes and incorporate some urban design elements to mitigate the impact. - Q: How many properties would be removed along the Halsted route? A: We'll discuss this at the individual community meetings and Open House. The focus of this meeting is effects on historic resources. - Q: Are the piers for the Halsted line in the sidewalk or street? A: That will be determined in future engineering phases. The straddle bent piers could encroach into the parking lane. - Q: Would the Halsted piers have a similar placement to the structure at the Morgan/Lake? A: Halsted Street has two travel lanes and a parking lane in each direction and is wider than the configuration at Lake Street. The pier type chosen will make a difference on placement too. There could be impacts on parking spaces. *Follow up note: All traffic impacts would be covered in the Transportation section of the Draft EIS.* - Q: How high is the structure along Halsted? A: It varies – roughly 23-30 feet above ground level; the necessary height is determined based on the street clearance requirements. - Comment: In talking with business owners at Galloy & Van Etten Stone Contractors, they are worried about their large trucks being able to access their sites.
4	**Section 106 Effects on National Register of Historic Places Eligible Resources** The team developed effects recommendations based on the conceptual alternatives described previously. JM stepped through each resource. The criteria for determining effects are defined in 36 CFR 800.5. For the three options of Union Pacific Railroad (UPRR) Alternative, the team examined the option that is closest to the historic resource, to represent the worst case analysis. - Q: Will you be sending a copy of the slides? A: The Effects Report provides general information and distances and CTA will have additional

Item No.	Item Description
	boards at the Open House, which will also be posted on CTA website. The effects slides contain preliminary deliberative materials so CTA will not be circulating copies. - Comment: The Cottage/Bungalow District that Neighborhood Housing Services of Chicago (NHS) commented on in the eligibility comments shows up in the map near the Pump Station. - WM: How close is the East Option UPRR track structure to the Pumping Station? A: It is close and almost adjacent– we'll have to look it up. *Follow-up note: Horizontally, it is about 8.8 feet between the pump station and track structure in the UPRR East Option. However this distance is based on conceptual engineering and can change slightly as additional detailed engineering is performed.* - Comment: If there is a future expansion along the UPRR line, we want to be sure that there is ample room to accommodate it. It would be good if the alternative were further from the building; I question whether it is actually a "No Effect" as shown. Response: It is a tight site at the Pumping Station. We are required to be outside of UPRR right-of-way. - Q: Does the analysis include staging areas as well? A: Yes. These are included in the footprints. - Q: How tall is the BRT garage by the Venetian Hall? A: 2 stories *Correction: it is 3 stories with some space for retail and community facilities at ground floor.* - Q: Are there any buildings in the footprint of the proposed garage? A: We looked at all the potential displacements associated with each alternative. There are no structures within the garage footprint that would be displaced. - Q: Is it a possibility to adopt/restore the Venetian Hall as part of the adjacent garage? Or incorporate similar elements in the garage design? A: If there is an adverse effect, we will try to mitigate that. We will look at improving the view of the garage and making it more street friendly. CTA can take this under consideration. - Q: NHS' eligibility comments included the cast masonry structures, one of which appears immediately south of the Venetian Hall. What was the determination there? A: Those were determined non-eligible; several were surveyed and lacked integrity and/or distinguishing architectural features. There wasn't a cohesive grouping either. - Q: What is the building across from the garage, next to Altgeld Gardens? A: There is a park; the buildings next to the park may be part of Golden Gate. - Q: What is the station like for UPRR at the west option? A: Trains stop, unload/load, and turn back. There is no yard or additional tracks at this location – the yard is proposed further north at 120th Street. - Comment: The garage could have a visual impact. Nothing else nearby is built at that scale/height. There may be an impact on the Altgeld Garden Historic District, which will likely gain historic significance into the future due to its association with President Obama. CTA should consider a more modest garage design. - Comment: Several parties would like to see a view of the West Terminal station option from directly across 130th Street at Altgeld. Response: Early communications with community members indicated a local preference for the South Station option, which would have an entrance south of 130th Street. - Comment: Both 130th UPRR station options need further study – there will be impacts to transportation, people's homes, etc. *Follow-up note: All other impacts will be discussed in the Draft EIS.* - Q: How difficult is it to cross from the south station to Altgeld or Philip Homes? A: 130th Street is on a viaduct that allows the tracks and platforms to extend under 130th Street. You wouldn't have to cross 130th Street to get to the Station, only a local street. - Q: Are the viaducts safe for travel?

Item No.	Item Description
	A: Vehicles travel on the 130th Street viaduct today. - Q: Will a station include CTA/CDOT landscaping improvements to link to Altgeld? A: Definitely. A study was conducted focusing on access and connectivity at 130th Street Station. CTA has coordinated and will continue to coordinate with CHA to integrate plans. - Comment: At the Green Street Historic District, track structure will certainly be visible and audible. - Q: What level of noise impacts are anticipated along Green Street? A: Noise mitigation measures (e.g. noise walls, closed deck, etc.) have been incorporated into preliminary designs to mitigate impacts. *Follow-up: Based on the general level noise analysis conducted per FTA guidance, the Green Street Historic District lies at the edge of the moderate noise impact zone, assuming the project includes 3-4 foot high noise barriers and a closed deck structure. Historic experts will reexamine potential effects on the Green Street Historic District.* - Comment: I think property owners who live within the Green Street Historic District would be adversely affected by the Halsted Alternative. Response: That will definitely be looked at as part of the National Environment Policy Act (NEPA) analysis. - Comment: As you look at this more, it would be nice to have a rendering showing how close the tracks are and what the relationship will look like between the Halsted line and Green Street district. - Comment: The former substation is city-owned and vacant. Consider incorporating it into the station. Maybe it could be an entry point. This provides a good opportunity to give back to the community by adopting some of the Chicago Historic Resources Survey Orange buildings, similar to measures at the Wilson station. - Comment: The French Eclectic House would experience the same impacts as Green Street. There are several nice homes within this block, possibly nicer than the resources along Green Street, though they lack the consistency of Green Street. Scale and noise will be issues. These areas could be negatively impacted, driving people to move out of the area. - Comment: Galloy and van Etten is a family business and has been in the area since 1899. Photos show the building dating to 1909; it is a huge resource for the area. The business owner feels like they would be so adversely affected by the Halsted Alternative that they would have to relocate. It is a fourth generation family-owned business and provides a lot of employment. They are also concerned about the proximity to the 119th Street yard. - Comment: A lot of businesses are within the 119th Street yard. It used to feed all of Roseland with jobs. Many of the buildings have been demolished but some are left and could be negatively impacted. Response: CTA is coordinating with Far South Community Development Corporation regarding potential impacts on businesses. - Comment: Several consulting parties requested renderings for the four adversely affected resources along Halsted. - Q: What about impacts on the rest of the cemetery? A: Only the gatehouse/entryway is considered eligible. Comment: The impacts on the cemetery will be assessed as part of NEPA analysis. - Q: Is the fire station within the rail yard still accessible? A: Yes. - Comment: By placing the tracks so close to the resource, are you precluding future viability of the resource to function? This is an issue at the fire station and the St. Peter & Paul Church in particular. TT: The fire station’s current location isn’t particularly viable as it is today. Perhaps relocating this building should be a consideration as part of mitigation, although we don’t typically like to

Item No.	***Item Description***
	move structures. The fire station would be more viable on an arterial. The trend city-wide has been to close a number of these smaller structures. - Comment: We've heard some good ideas regarding mitigation, but there are a few steps between now and then. We still have to have a selected alternative before developing detailed mitigation measures.
5	**Schedule and Next Steps** There is an open house next week. A Draft EIS is being prepared, which will include additional analyses and public involvement opportunities. - Q: When would a single preferred alternative be selected? A: The Final EIS would be prepared on a single alternative. - Q: Is there a way to understand whether any of the resources we identified in the eligibility phase that were not determined eligible would be affected? A: They were not examined as part of this analysis since we evaluated only eligible buildings or districts for Effects determination. - Comment: Please resend the responses to eligibility comments.

Please notify ST of any corrections and/or clarifications to the minutes within five (5) business days.

cc: Attendees

Red Line Extension (RLE) Summary of Effects Comments received from the Consulting Parties and Responses from the Project Team

The following paragraphs briefly summarize comments received from the consulting parties regarding the project effects on historic resources for the RLE Project and corresponding responses from the project team. Under the Section 106 consultation process, the Chicago Transit Authority (CTA) undertook an extensive data collection and analysis effort during fall 2012 to identify historic resources located within the Area of Potential Effect (APE) for the three build alternatives that are under evaluation in the RLE Draft Environmental Impact Statement (EIS). This analysis culminated in recommendations regarding the potential eligibility of historic resources pursuant to the National Historic Preservation Act of 1966. These recommendations were presented to the ten consulting parties, including the Illinois Historic Preservation Agency (IHPA), during a meeting on January 30, 2013. Input from consulting parties was considered throughout 2013, resulting in 13 individual properties and two historic districts being identified as eligible under the National Register of Historic Places (NRHP) criteria.

Following this step in the consultation process, CTA undertook an analysis of effects on NRHP-eligible historic properties in accordance with criteria established in 36 CFR 800.5. This analysis culminated in recommendations regarding the potential effects on historic resources, which were mailed to consulting parties on April 18, 2014, requesting any written comments by May 23, 2014. An in-person meeting was conducted on May 8, 2014 to discuss these recommendations. Participants were asked to provide relevant information from their perspective that may supplement the effects recommendations summarized in the April 18 packet. Written comments were received from the following four organizations:

- Anne Haaker, Illinois Historic Preservation Agency (IHPA)
- Lisa DiChiera, Landmarks Illinois
- Matt Cole, Neighborhood Housing Services of Chicago
- Terry Tatum, City of Chicago, Department of Planning and Development, Historic Preservation Division

Comments and responses are presented by general topic below. Based on local knowledge and input from the consulting parties, additional analysis was undertaken regarding historic resources within the APE. The original recommendations presented in April/May 2014 will be revised as described below and presented in the RLE Draft EIS.

The CTA announced on August 10, 2014 that as part of its planning process to extend rail service to 130th Street on the far South Side, it has narrowed down the alternatives to two preliminary options for the proposed RLE Project. Based on feedback received from the public this spring and summer via community meetings and comments provided to the agency, the CTA is now focusing on one “preferred alternative” with two possible variations from the three build alternatives that have been under consideration. The CTA believes these options would best serve communities and residents on the Far South Side:

≠ Union Pacific Railroad Rail (UPRR) Alternative, East Option. Under this option, CTA tracks would be placed immediately east of the Union Pacific railroad right-of-way from 99th Street to 118th Street

- ≠ UPRR Alternative, West Option. Under this option, CTA tracks would be placed immediately west of Union Pacific's right-of-way from 99th Street to north of 118th Street.

The proposed alignment of the rapid transit line would be the same for the two East and West options north of 99th Street and south of 118th Street.

Eligibility Reconsideration Requests

1. Resurvey the grouping of Chicago bungalows and frame cottages at 103rd Street to 104th Place between the UPRR line and Princeton Avenue.
   Nine resources (Chicago bungalows and frame cottages) were surveyed as part of the representative sample of surveys. Although the area contains numerous residences with similar architectural styles, massing, setbacks, and construction dates, architectural historians verified that these properties do not retain sufficient integrity for the NRHP as a district due to contemporary alterations (e.g., replacement siding, porches, windows, and doors). None were found to merit individual listing for the NRHP due to their integrity. Numerous vacant lots disrupt the visual cohesiveness of this area. Despite the general consistency in property types, the collection of bungalows and frame cottages is broadly representative of residential areas on the South Side, lacking the distinguishing elements to qualify as NRHP eligible. Please refer to forms 301, 306, 321, or 326 W 103rd Place; 262, 328, or 335 W 104th Place; or 310 or 325 W 104th Street on the Eligibility DVD provided to consulting parties on January 4, 2013 for specific examples.

2. Reconsider eligibility determinations for cast stone-faced residences adjacent to the UPRR right-of-way, including the property adjacent to the Venetian Hall.
   The properties adjacent to the Venetian Hall are a brick two-flat (129 E Kensington Ave on southwest side) and a vinyl-clad multi-residence (141 E Kensington Ave on the east side). Neither building exhibits distinctive architectural features or sufficient integrity for inclusion on the NRHP. Likewise, the two cast stone-faced houses facing the Venetian Hall (122 and 136 E Kensington Ave) do not feature distinctive architectural elements or sufficient integrity for inclusion on the NRHP. Architectural historians verified that these properties do not retain sufficient integrity for the NRHP due to contemporary alterations (e.g., replacement porch, windows, and doors), compromising the historic materials and workmanship. No cohesive set of similar properties has been identified in the vicinity that would merit consideration as a potential historic district or multiple property grouping.

3. Reassess the area around 111th Street at Emerald Avenue for a potential district.
   CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The area around 111th Street at Emerald Avenue is distant from the UPRR Alterative corridor and would not be affected by the RLE Project.

Effects Reconsideration Requests

4. Reevaluate the visual, noise, and economic effects of the Halsted Alternative on the Green Street Historic District, which could have a significant impact on the quality of life without proper mitigation.
   CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The Green Street Historic District is distant from the UPRR Alterative

corridor and would not be affected by the RLE Project.

5. Reassess No Effect finding for the Altgeld Gardens Historic District based on the UPRR Alternative. The proposed station and garage would alter the landscape; a rendering should be developed.
   Altgeld Gardens Historic District is eligible for NRHP listing under Criterion A (i.e., events that have made a significant contribution to the broad patterns of American history on a local, state, and/or national level) based on its association with community development, planning, and social history. As defined by 36 CFR 800.5, an adverse effect on this resource would be an "alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the NRHP." While the UPRR Rail Alternative would increase transportation choices and improve access for this geographically isolated area, none of the proposed infrastructure improvements in the vicinity would significantly alter the characteristics that qualify the district as eligible for NRHP listing. As part of the UPRR Rail Alternative, an at-grade station and parking facilities would be constructed in one of two locations to provide access to the Altgeld Gardens Housing Project: a South Station Option or a West Station Option. Either station location option is separated from Altgeld Gardens Historic District by a multi-lane street (i.e., E. 130th Street and/or E. 130th Place). Preliminary plans for each terminal station option would include parking for 2,300 vehicles through a combination of a parking structure and surface parking lots.

   The South Station Option parking structure for the UPRR 130th Street Station is approximately 800 feet from Altgeld Gardens Historic District at its closest point; the parking structure would not be visible from within the historic district and would not adversely affect the historic district.

   The West Station Option parking structure for the UPRR 130th Street Station is approximately 400 feet from Altgeld Gardens Historic District at its closest point and would only be visible from the outer line of buildings on the north side of the Altgeld Gardens development. This outer row of buildings would obstruct the view of the parking structure from interior buildings and streets. The construction of the West Station Option would not adversely affect the characteristics that qualify the district as eligible for NRHP listing, i.e. its association with community development, planning, and social history.

   As the project would not adversely affect the integrity of the district or its association with community development, planning, and social history, any visual simulation rendering and any appropriate mitigation measures identified would occur independent of the formal Section 106 consultation process for this resource.

   The UPRR Alternative has been selected as the National Environmental Policy Act (NEPA) Preferred Alternative, and an additional rendering of the station will be developed and presented as part of the Draft EIS to assist local stakeholders in understanding the extent of visual impacts created by the project.

6. Reassess No Effect finding for the Roseland Pumping Station based on the UPRR Alternative.
   For the UPRR East Option, the track structure is approximately 8.8 feet from the side of the building at its nearest point. It should be noted that an existing at-grade freight line runs in close proximity to this location. The pumping station would not be displaced or directly affected by the UPRR Rail Alternative. The changes in the setting (e.g., visual, noise, vibration, etc.) would

not adversely affect the characteristics that qualify the resource as eligible for NRHP listing, i.e. its architecture.

The UPRR West Option would also not affect the characteristics that qualify the resource as eligible for NRHP listing.

7. CTA should develop appropriate renderings for all properties in the APE where there was a finding of No Adverse Effect or Adverse Effect.
   CTA will develop additional visual simulation renderings, for inclusion in the Draft EIS, of the UPRR Alternative, which has been selected as the NEPA Preferred Alternative. Renderings are particularly helpful in understanding the extent of visual impacts and in developing appropriate mitigation measures for any adversely affected historic resources.

   At the current stage of Effects consultation, additional renderings would not change the effects findings for NRHP-eligible resources. Justification for effects findings was provided in the effects report mailed to consulting parties and additional justification is included in this document. As a reminder, the key consideration is whether the project would alter the specific characteristics that qualify a resource as eligible for the NRHP.

   In addition to the Historic impacts, the Draft EIS will also include a discussion of the potential visual impacts of the RLE Project alternatives, including general renderings of the alternatives that were prepared to assess those impacts. Some of those renderings were also presented at the May 13th CTA open house and the exhibit boards can be viewed at http://www.transitchicago.com/assets/1/red_ahead/MS_CWC_CL_RLE_Exhibit_Boards_lowres_FINAL_20140515.pdf

8. Renderings should be developed for any NRHP or Chicago Historic Resources Survey (CHRS) Orange properties potentially impacted by the close proximity of the proposed elevated track structures.
   See Response #7.

9. The property owner of the Galloy and Van Etten Stone Contractors business is concerned about their access and viability if the Halsted Alternative is built.
   CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The Galloy and Van Etten Stone Contractors business is distant from the UPRR Alternative corridor and would not be impacted.

10. Noise studies should be undertaken to demonstrate that the introduction of the elevated rail structure on Halsted would not adversely affect historic resources within the APE of that route.
    CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. Noise analysis has been conducted per Federal Transit Administration (FTA) guidance and mitigation measures have been identified, which will be presented in the Draft EIS.

11. The French Eclectic House would experience the same impacts as Green Street. Scale and noise would be issues. These areas could be negatively impacted, driving people to move out of the area.

CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued. The French Eclectic House is distant from the UPRR Alterative corridor and would not be affected by the RLE Project.

Other Comments

12. In general, we [IHPA] concur with the findings concerning historic architectural resources presented in the draft report. The Bus Rapid Transit (BRT) Alternative would have the least impacts, followed by the UPRR Alternative.

13. The potential to encounter archaeological resources needs to be addressed. If the potential for undisturbed archaeological resources exists, a survey will be required.
    No previously recorded archaeological sites fall within the RLE APE and therefore the project would produce no effect on known archaeological resources. The need for and extent of further archaeological investigations will be determined in consultation with IHPA.

14. CTA should consider incorporating the city-owned, vacant historic substation (10227 S. Halsted Street) into plans for the nearby station.
    CTA has narrowed down the alternatives for the RLE Project and the Halsted Alternative is no longer being pursued; the vacant historic substation would not be affected by the RLE Project.

Dear Ms. Tandon:

Thank you for requesting comments from our office concerning the possible effects of the referenced project on cultural resources. Our comments are required by Section 106 of the National Historic Preservation Act of 1966, as amended, and its implementing regulations, 36 CFR 800: "Protection of Historic Properties".

We are in receipt of the 2014 *Draft Effects Report*, and appreciated the opportunity to participate in the May 8, 2014 meeting at the CTA where your findings were presented. In general we concur with the findings concerning historic architectural resources presented in the draft report. However, the report indicates that noise walls will reduce the amount of noise that resources such as the proposed Green Street Historic District will experience. Noise studies that include current conditions will need to be undertaken to demonstrate that the introduction of the elevated rail structure on Halstead will not adversely affect historic resources located within the APE of that route.

It was noted in the report that archaeological resources may be uncovered during construction activities and that they would be investigated once found. At a minimum, the potential to encounter archaeological resources needs to be addressed and the results need to be presented to this office for review. If the potential for undisturbed archaeological resources exists within the areas of potential effect, a survey will be required.

As previously stated, it is our opinion that the proposed BRT route will affect the least amount of cultural resources located within its APE. We also believe the UPRR route that is often adjacent to existing railroad tracks will affect fewer resources than the elevated line proposed on Halsted Street.

We look forward to reviewing the final historic resources report once the preferred alternative has been selected and all cultural resource surveys have been completed.

If you have questions please contact David J. Halpin, Cultural Resources Manager, at 217-785-4998.

Sincerely,

Anne E. Haaker

RE: Red Line Extension – Potential Effects Consultation Comments

Dear Ms. Tandon,

Thank you for the opportunity to review on May 8th the Red Line Extension team's findings and recommendations regarding historic properties in the APE. We are pleased to see some additions made to the list of National Register-eligible properties and the identification of orange-rated buildings in the Chicago Historic Resources Survey (CHRS) based on our February 18, 2013 letter.

From the May 8th meeting, we have the following comments:

- We strongly recommend that better renderings are produced to illustrate the potential impact of a UPRR West Station and four-story parking garage on 130th Street and the adjacent Altgeld Gardens Historic District.
- We agree with comments made during the meeting that the "No Effect" determination made for the Roseland Pumping Station, 351 W. 104th St., and Altgeld Gardens Housing Project Historic District, under the UPRR Rail scenario, should be reassessed as potentially having an "Adverse Effect" determination.
- We recommend producing renderings that will illustrate the "Adverse Effect" on National Register-eligible properties in the Halsted Rail scenario. This is particularly important if the proximity of rail tracks could potentially make these properties less viable in the future. These properties include:
    - The Former Classic Revival Substation, 10227 S. Halsted St.
    - The S.S. Peter & Paul Catholic Church at 12433-12439 S. Halsted St.
    - Cedar Park Cemetery Entryway and Gatehouse, 12540 S. Halsted St.
    - Fire Department Engine Company 115, 931 W. 120th St.
- While we understand that the design phase of a Halsted Rail scenario, if selected, will be some time later, we would like consideration to be made of incorporating the city-owned and vacant historic substation at 10227 S. Halsted St. into plans for a station that was indicated would be built in that vicinity.
- Lastly, we support the reassessments suggested by Matt Cole of Neighborhood Housing Services in his May 14, 2014 letter.

Again, thank you for the opportunity to review the findings by your team for this project.

Sincerely,
Lisa Di Chiera

RE: Red Line Extension – Potential Impacts to National Register Eligible Properties in APE

Dear Ms. Tandon,

Thank you again for inviting NHS to participate in the Section 106 review process for the Red Line Extension project. We believe that extending the Red Line will ultimately enhance the livability and well-being of the greater Roseland-area. At the same time, as an organization rooted in the use of asset-based community development strategies, we wish to ensure that the project minimizes any undue impacts on the existing residential, community, and historic buildings that make these neighborhoods great and that our experience has shown can be important community-building and engagement assets. Therefore, based on the information presented in the May 9th Effects Meeting, we recommend that the following additional actions be undertaken by the project team before any mitigation planning is undertaken:

- Develop appropriate and assessable renderings for all properties in the APE where there was a finding of No Adverse Effect or Adverse Effect. This currently includes the Former Venetian Hall, the Green Street Historic District, the Former Classical Revival Substation, Galloy and Van Etten Stone Contractors, S.S. Peter & Paul Catholic Church, Cedar Park Cemetary Entryway and Gatehouse, and Fire Department Engine Company 115. We also believe that such renderings should be created, as necessary, based on our recommendations below (e.g, re: Altgeld Garden Historic District).
- Re-Survey 103rd Street to 104th Place between the UPRR and Princeton Avenue: This area includes the previously identified, National Register-eligible Roseland Pumping Station and Roseland Fire Station properties. However, the blocks also include a largely intact and well-maintained grouping of Chicago bungalows and frame cottages. We would encourage the project team re-survey these blocks to determine if these residential properties could contribute to a future National Register district, as well as any potential impact that a UPRR-located elevated train line would have on such a district.
- Reassess Determination that Cast Stone-faced Residences in APE are not National Register Eligible: Several of these buildings, which look similar to Chicago Greystones and are relatively rare, were observed adjacent to the UPRR right-of-way. This includes the 2-flat on Kensington Avenue immediately east of the Former Venetian Hall.
- Reassess Finding of No Adverse Effect on Potential Green Street Historic District: Re-evaluate visual, noise, and economic effects of a Halsted-located elevated train line on homes along Green

Street. While such train lines do run through other residential areas of Chicago (e.g., Pink Line), this corridor would be new and could have a significant impact on the quality of life of the area without proper mitigation.

- Reassess Area Around 111th Street and Emerald Avenue for Potential Historic District: Re-survey area around 11310 South Emerald (Emerald, Union, and Wallace Avenues) for eligibility as a historic district. If determined eligible, assess effect of a Halsted-located elevated train line on the district.
- Reassess Finding of No Effect of a UPRR West Station on Altgeld Gardens Historic District: The proposed station, station house, and four-story parking garage would be located immediately to the north of Altgeld Gardens. The height of the parking garage would be taller than any other properties in the area and would likely loom above the landscaped tree line of 130th Street. The existing rendering of the proposed station developed by project team is inadequate to assess the effect of the station due to its oblique view from the west.

Thank you again for inviting NHS to participate in the Section 106 review for the Red Line Extension project. Please let us know if we can be of further assistance before the next scheduled consultation.

Best,

Matt Cole

Subject: Red Line Extension Historic Properties Consultation

Dear Ms. Tandon,

Thank you for hosting the consulting parties meeting held at CTA headquarters on May 8, 2014 for the Red Line Extension Historic Properties Consultation. We appreciate the opportunity to comment on the draft effects to historic properties that were discussed at that meeting.

Based on information provided, our comments are as follows:

1. Properties determined to be historic and/or color coded orange in the Chicago Historic Resources Survey and that would be potentially impacted by close proximity of elevated tracks under any of the alternative routes being considered should have photo renderings executed to show the effect of such close proximity of tracks. This would mainly include properties along the Halsted St. alternative, but would also include the UPRR east alternative route as it would affect the Roseland Pumping Station.

Our office looks forward to continuing to work with you on this exciting undertaking.

Sincerely,

Terry Tatum

Section 1
Summary

This technical memorandum analyzes the potential impacts of the Red Line Extension (RLE) Project with respect to hazardous materials, and presents the regulatory framework and evaluation methods used for the analysis.

1.1 Evaluation

The first step of the analysis was to identify potential or existing conditions that could result in hazardous material impacts. A general inspection field visit was performed. Analysis included a review of historical topographic maps, aerials, and fire insurance maps; a regulatory database search; and a review of agency files for a select number of sites. Identified sites were then ranked as No Concern, Low Concern, Moderate Concern, or High Concern, based on their potential to have impacts related to hazardous materials. The potential for encountering other sources of hazardous material impacts, such as urban fill, transformers, substations, and buildings constructed prior to 1978 or 1979 was also assessed.

1.2 Findings

1.2.1 Impacts

While no potential hazardous material impacts would occur as a result of the No Build Alternative, there would be the potential for permanent and construction hazardous material impacts as a result of the Bus Rapid Transit (BRT) Alternative, Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Rail Alternative.

1.2.1.1 Permanent Impacts

Operating BRT service would not result in changes to the existing types of hazardous materials used, stored, or transported; therefore, the BRT Alternative would not result in permanent impacts.

Operation of the UPRR Rail and Halsted Rail Alternatives has the potential to result in permanent hazardous material impacts from accidental spills or from maintenance activities that require earthmoving in contaminated areas. Spills are most likely to occur during activities such as equipment maintenance at the yards and shops and grounds maintenance along the tracks. Materials typically used for these activities include fuel, oil, paints, solvents, cleaning agents, herbicides, and pesticides. Examples of maintenance activities that could require earthmoving include at-grade track repair, underground utility work, and foundation repairs.

The UPRR Rail Alternative also has the potential for additional hazardous material impacts associated with the adjacent operating UPRR (with the East and West Options) or Northern Indiana Commuter Transportation District Chicago South Shore & South Bend Railroad ([NICTD/CSS & SBRR] with the ROW, East, and West Options). Due to the proximity of the UPRR and NICTD/CSS & SBRR to the UPRR Rail Alternative alignments, hazardous material spills or releases that occur along these railroads would have the potential to migrate and affect the UPRR Rail Alternative alignments. These materials potentially exist along the railroad currently, but the UPRR Rail Alternative would bring transit vehicles closer to them. Spills along the UPRR and NICTD/CSS & SBRR could occur from the use of chemicals for ground maintenance along the tracks. In addition, because these are freight lines, releases could occur from creosote used to preserve wood railroad ties; polynuclear aromatic (PNA) compound deposition from diesel exhaust; asbestos dust from brakes; and coal ash releases from engines. Freight lines might also transport hazardous material cargo, which could be released if there were a spill or accident.

Although there is the potential for impacts associated with the adjacent freight lines, these impacts would be reduced by the freight lines' adherence to federal hazardous material transport regulations (49 Code of Federal Regulations [CFR] Parts 171 to 180) that among other things, specify requirements for the safe transportation of hazardous materials by rail and require rail carriers to conduct a security and safety risk analysis, to develop a security and safety risk plan that includes measures to mitigate risk to population centers, and to select the safest route.

1.2.1.2 Construction Impacts

Construction impacts could occur when activities such as earthmoving and demolition encounter contaminated soil and/or groundwater. Hazardous materials typically involved with construction activities, such as paints, solvents, fuels and hydraulic fluids, could also be accidentally released during construction.

The affected environment evaluation described in Section 4 found that the potential to encounter hazardous materials during construction exists across the entire project area for the BRT, UPRR Rail, and Halsted Rail Alternatives. This potential is due to the urban setting of the project area, where the potential exists for the presence of fill materials previously deposited widespread across the entire project area. Typical urban fill materials contain elevated concentrations of polynuclear aromatic hydrocarbons and metals due to nearby roadways, railways, and industrial and commercial land uses. In addition, urban fill may include contaminated building demolition debris, which was commonly used as fill material in excavations, to increase elevations at sites during development.

Although there would be the potential to encounter hazardous materials during construction throughout the project area, the greatest potential for impacts would be from High Concern sites within the permanent envelope of an alternative. Table 1-1 presents a summary of High Concern sites within the permanent envelopes of alternatives, by segments.

Table 1-1: Summary of High Concern Sites Within the Permanent Envelope

Segment	Number of High Concern Sites Within Envelope	Figure 4-1 ID Numbers	Notes
Bus Rapid Transit Alternative			
Full Length	1	200	
Park & Ride Facilities*	1	200	
Union Pacific Railroad Rail Alternative Right–of-Way Option			
Segment UA	0	---	
Segment UB	4	122,151/162, 200, O4	
120th Street Yard and Shop	3	151/162, 200, O4	Includes one archived CERCLIS -No Further Remediation Planned site**
Union Pacific Railroad Rail Alternative East Option			
Segment UA	2	70, 104	
Segment UB	4	122, 151/162, 200, O4	Includes one archived CERCLIS-No Further Remediation Planned site**
120th Street Yard and Shop	3	151/162, 200, O4	Includes one archived CERCLIS-No Further Remediation Planned site**
Union Pacific Railroad Rail Alternative West Option			
Segment UA	2	51, 105	
Segment UB	4	122, 151/162, 200, O4	Includes one archived CERCLIS-No Further Remediation Planned site**
120th Street Yard and Shop	3	151/162, 200, O4	Includes one archived CERCLIS-No Further Remediation Planned site**
Halsted Rail Alternative			
Segment HA	1	18a	
Segment HB	0	---	
119th Street Yard and Shop	6	141, 144, 152a, 154, NL1, 152b	Includes one active CERCLIS and one CERCLIS-No Further Remediation Planned site **

Notes:

* Includes sites only within the proposed park & ride facilities.

** Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) sites typically come with increased risk of United States Environmental Protection Agency (USEPA) imposing liability and remediation obligations on potentially responsible parties (PRPs). Any owner can be considered a PRP and be required to pay for cleanup. Therefore, additional caution should be taken before acquiring ownership.

Other common sources of hazardous materials that may be present or that could affect the BRT, UPRR Rail, and Halsted Rail Alternatives during construction include transformers and substations within the project area that may contain hazardous materials including polychlorinated biphenyls (PCBs) and buildings and structures built before 1978–1979 that may likely contain lead-based paint or asbestos and releases could occur during their demolition. Hazardous materials typically involved with construction activities, such as paints, solvents, fuels, and hydraulic fluids, could also be accidentally released during construction.

1.2.2 Cumulative Impacts

For the No Build Alternative, no permanent adverse impacts, construction impacts, or cumulative impacts related to hazardous materials would be expected. Under the BRT, UPRR Rail, and Halsted Rail Alternatives, cumulative impacts could occur if there were a release of hazardous materials during ongoing and future projects in the area (described in the *Cumulative Impacts Technical Memorandum)*; however, compliance with local, state, and federal laws and regulations would result in these cumulative impacts being less than adverse.

1.2.3 Mitigation

Permanent mitigation measures for the BRT, UPRR Rail, and Halsted Rail Alternatives would include adherence to applicable federal, state, and local regulations, as well as Chicago Transit Authority's (CTA's) existing system-wide hazardous material usage, storage, and disposal plans and procedures.

Construction mitigation measures for the BRT, UPRR Rail, and Halsted Rail Alternatives would include compliance with federal, state, and local laws and regulations regarding hazardous materials, conducting focused site assessments for areas where earthmoving activities would occur, conducting asbestos, lead-based paint, and hazardous material surveys of buildings or structures that would be demolished. Mitigation measures would also include developing a contaminated material management plan; health and safety plans for construction activities; a spill prevention, control, and countermeasure plan; and a construction stormwater pollution prevention plan prior to construction. In addition, a Phase I Environmental Site Assessment (ESA) of any property to be acquired would be conducted as part of the Final Environmental Impact Statement (Final EIS) and prior to acquisition in order to identify recognized environmental conditions and assess and limit environmental liability. Based on the Phase I ESA findings, a Phase II ESA could also be required during the property acquisition phase and prior to purchasing a property.

1.2.4 Impacts Remaining After Mitigation

No adverse impacts would remain after mitigation for the BRT, UPRR Rail, and Halsted Rail Alternatives.

1.3 2014-2015 Red Line Extension Project Update

Updated July 27, 2015
In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix C of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix C supersedes information presented in other chapters of this technical memorandum.

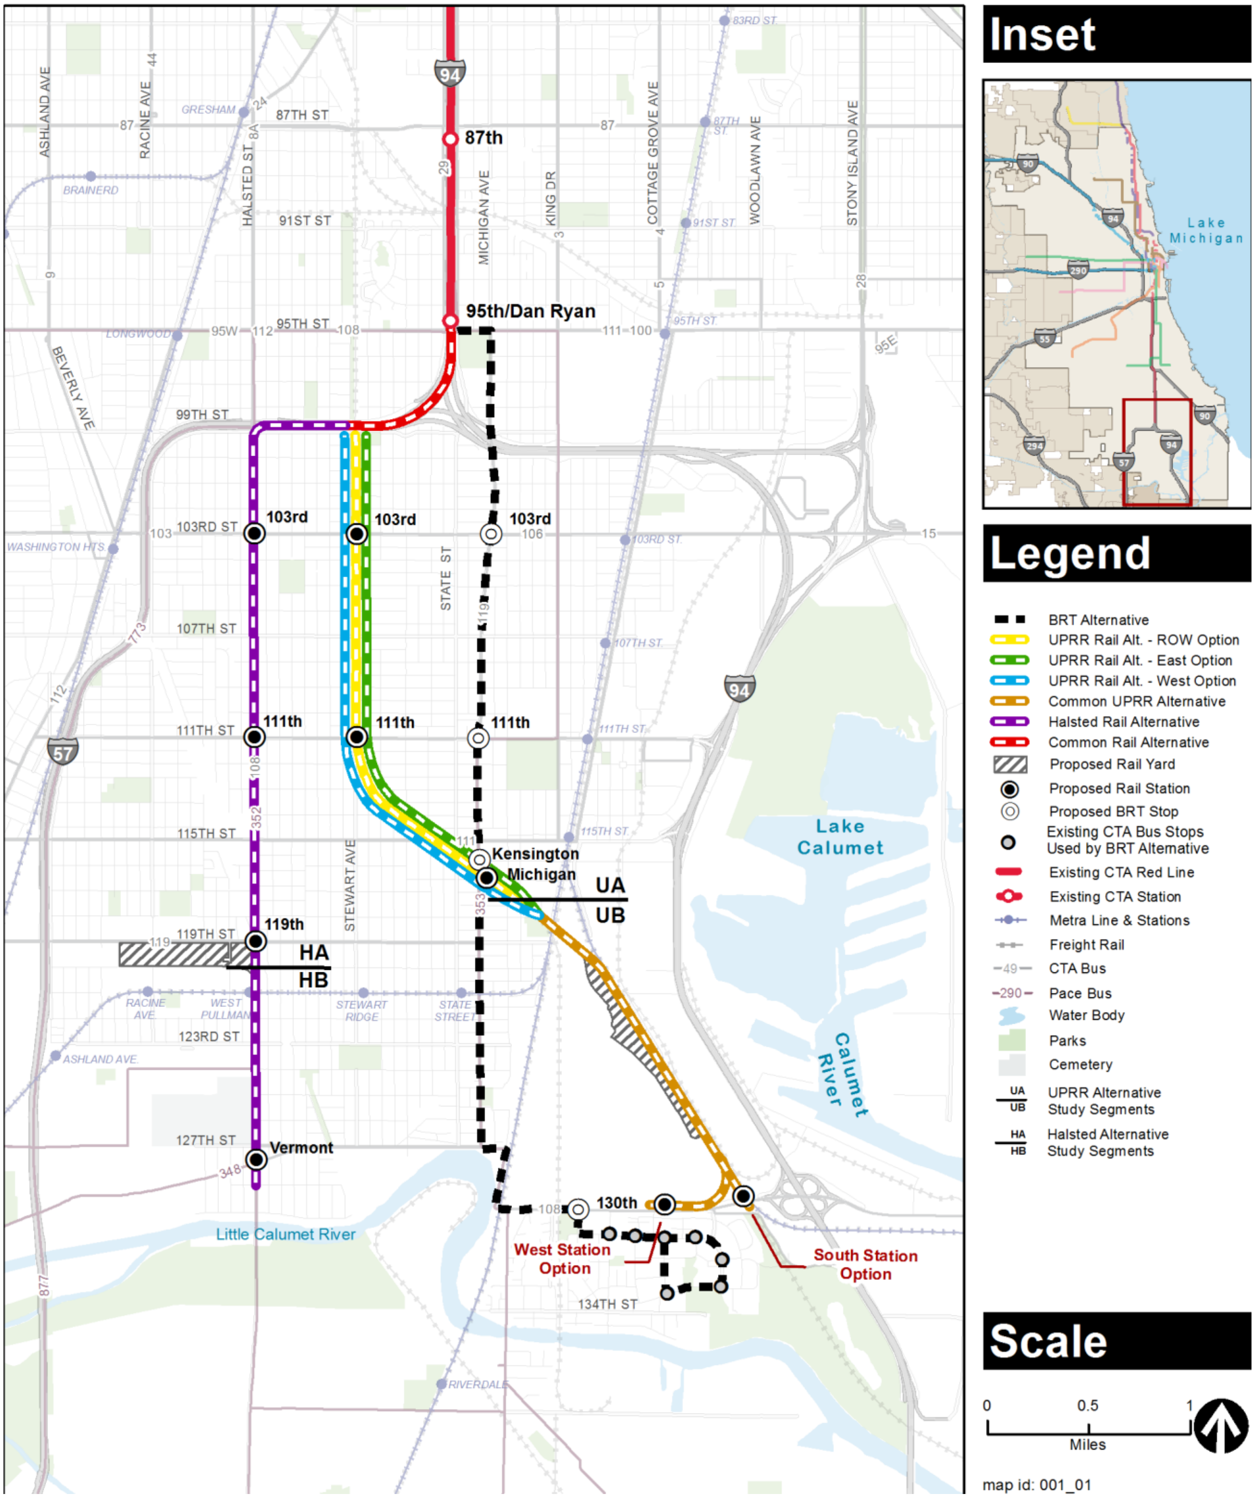
Section 2
Project Description

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft EIS focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
    - Right-of-Way (ROW) Option
    - East Option
    - West Option
- Halsted Rail Alternative



Inset

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement Program (TIP) and the improvements to 95th Street Terminal. The TIP projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

This section describes the process used to conduct an analysis of potential permanent, construction, and cumulative hazardous material impacts that could result from the construction and operation of the alternatives analyzed in the EIS for the RLE Project. This analysis also identifies potential options to avoid, minimize, and mitigate adverse impacts.

3.1 Regulatory Framework

The following sections describe the regulatory framework applicable to the jurisdictions in the project area.

3.1.1 Federal

The U.S. Environmental Protection Agency (USEPA) is the lead federal agency responsible for enforcing federal regulations regarding hazardous materials. One exception is the transport of hazardous materials, which is regulated by the U.S. Department of Transportation (USDOT). The primary federal legislation governing hazardous materials includes the Resource Conservation and Recovery Act (RCRA), the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), the Superfund Amendments and Reauthorization Act (SARA) and the Hazardous Materials Transportation (HMT) Act.

3.1.1.1 Resource Conservation and Recovery Act

The RCRA regulates the generation, transportation, treatment, storage and disposal of hazardous waste through comprehensive life cycle or "cradle to grave" tracking requirements. These requirements include inspection logs of hazardous waste storage locations, records of quantities being generated and stored, and manifests of pick-ups and deliveries to licensed treatment/storage/disposal facilities. The RCRA also identifies standards for treatment, storage, and disposal.

3.1.1.2 Comprehensive Environmental Response, Compensation, and Liability Act

The CERCLA, also known as Superfund, created a tax on the chemical and petroleum industries to provide for response and cleanup of hazardous substances that may endanger public health or the environment. The CERCLA established requirements for abandoned hazardous waste sites and provided for liability of persons responsible for releases of hazardous waste at these sites.

3.1.1.3 Superfund Amendments and Reauthorization Act

The SARA amended CERCLA to increase state involvement and required Superfund actions to consider state environmental laws and regulations. The SARA also established a regulatory program for underground storage tanks (USTs) and the Emergency Planning and Community Right-to-Know Act.

3.1.1.4 Clean Air Act

The Clean Air Act regulates air emissions from stationary and mobile sources. Under Section 112 of the Clean Air Act, National Emissions Standards for Hazardous Air Pollutants were established to protect the public from exposure to airborne contaminants, such as asbestos, that are known to be hazardous to human health.

3.1.1.5 Toxic Substances Control Act

The Toxic Substances Control Act established the mechanisms by which USEPA tracks, screens, and tests industrial chemicals that are produced or imported into the United States and that may pose an environmental or human health hazard. The Toxic Substances Control Act addresses the production, importation, use, and disposal of specific chemicals including PCBs, asbestos, radon, and lead-based paint.

3.1.1.6 Federal Occupational Safety and Health Act

The Occupational Safety and Health Administration (OSHA) administers legislation that requires special training for handlers of hazardous materials, notification to employees who work in the vicinity of hazardous materials, acquisition from the manufacturer of material safety data sheets that describe the proper use of hazardous materials, and training of employees to remediate any hazardous material accidental releases. The OSHA legislation regulates lead and asbestos as it relates to employee safety through a set of requirements for notification and corrective action, warning signs and labels, controlled access, use of protective equipment, demolition/renovation procedures, housekeeping controls, training, and in certain cases, air monitoring and medical surveillance to reduce potential exposure.

3.1.1.7 Hazardous Materials Transportation Act

The HMT Act was published in 1975 and improved the regulatory and enforcement authority of the Secretary of Transportation. The purpose of the HMT Act was to provide protection against the risks associated with hazardous material transport in commerce. The Pipeline and Hazardous Materials Safety Administration, a part of the USDOT, is responsible for developing regulations and standards associated with the transport of hazardous materials. These regulations are provided in 49 CFR Parts 171 to 180 and are enforced by the respective mode administrations, such as the Federal Railroad Administration and Federal Highway Administration. Among other things, the regulations specify requirements for the safe transportation of hazardous materials including classification, handling, and packaging requirements. For rail transport, regulations require the carrier to conduct a security and safety risk analysis, develop a security and safety risk plan that includes measure to mitigate risk to population centers, and to select the safest route.

3.1.2 State

3.1.2.1 Illinois Environmental Protection Act

The Illinois Environmental Protection Act (the Act) is Illinois' primary statute for protecting and restoring the environment. The Illinois Pollution Control Board, an independent agency created by the Act, is responsible for adopting Illinois' environmental regulations and deciding contested environmental cases. In addition, the Act created the Illinois Environmental Protection Agency (IEPA), the primary state agency responsible for the regulation of hazardous materials in Illinois.

The IEPA's Bureau of Land is responsible for the protection and restoration of land and groundwater resources in the State of Illinois. It administers a broad variety of solid and hazardous waste management cleanup programs, including the Leaking Underground Storage Tanks (LUSTs) program, the Site Remediation Program and RCRA Part B Permits and Closure Plans. The IEPA's cleanup programs use IEPA's Tiered Approach to Corrective Action Objectives (TACO) (35 Illinois Administrative Code [IAC] Part 742).

The TACO provides procedures for evaluating the risk to human health posed by environmental conditions and developing remediation objectives that achieve acceptable risk levels in soil and groundwater. The first step of TACO is a Tier 1 evaluation, which compares concentrations of contaminants detected at a site to a standard set of objectives, known as the Tier 1 remediation objectives. The TACO process and Tier 1 objectives incorporate the results of a polynuclear aromatic hydrocarbon study conducted by the City of Chicago. This study determined background concentrations of polynuclear aromatic hydrocarbons within City of Chicago limits.

Effective August 27, 2012, the IEPA amended the Clean Construction or Demolition Debris Fill Operations (35 IAC Part 1100) to among other things, include standards for the maximum allowable concentrations of chemical constituents in uncontaminated soil generated during construction or demolition activities that can be used as fill material at Clean Construction or Demolition Debris facilities and uncontaminated soil fill operations.

3.1.2.2 Office of the State Fire Marshal

The Office of the State Fire Marshal also has responsibility regarding hazardous material regulation. The Office of the State Fire Marshal's Division of Petroleum & Chemical Safety manages the problems caused by the thousands of UST systems containing petroleum or hazardous chemicals. The division regulates petroleum and chemical storage tanks through registration to ensure the protection of public health and safety.

3.1.2.3 Illinois Occupational Safety and Health Program

At the state level, Illinois operates only a public sector occupational safety and health program under a plan approved by the U.S. Department of Labor. This program is administered by the Illinois Department of Labor and provides safety and health protections to state and local government employees within the state. Private sector workers in Illinois are covered by OSHA at the federal level.

3.1.3 Local

The following local jurisdictions and departments regulate and oversee issues related to hazardous materials within the project area:

- City of Chicago Fire Department, Hazardous Materials Unit

- City of Chicago, Department of Public Health, Environmental Permits & Regulation
- City of Chicago, Department of Fleet and Facility Management, Bureau of Environmental Management

3.2 Impact Analysis Thresholds

There are no specific NEPA thresholds for determining potential adverse impacts related to hazardous materials; however, the Federal Transit Administration's (FTA's) process for implementing NEPA (FTA 2012) does require an evaluation of potential impacts related to hazardous materials. The FTA's process for implementing NEPA requires an evaluation of potential impacts related to hazardous materials. Generally, projects that include the purchase of new ROWs, excavation, and/or structure demolition or modification require at least an initial site assessment to determine whether any known or potential hazardous material is present within the potential area of impact.

For the purpose of this impacts analysis, a hazardous material is any media such as soil, groundwater, or building materials that contain detectable concentrations of any state or federally regulated contaminant. An impact would be considered adverse if it would have the potential for the following:

- Harm to human health or the environment through the routine transport, use, or disposal of hazardous materials
- Harm to human health or the environment through the accidental release of hazardous materials into the environment

3.3 Area of Potential Impact

The area of potential impact for determining hazardous material impacts from regulated sites includes sites within an approximately 0.1- and 0.25-mile radius of the RLE Project alternative alignments, with the radius depending on the type of regulated site being evaluated (See Section 3. 4.1.1). The area of potential impact associated with the general historical land use includes parcels adjacent to and with the RLE Project alternatives.

3.4 Methods

The evaluation of potential impacts associated with hazardous materials began with a review of existing sources of data. The potential for construction and/or operation of each alternative to have hazardous material impacts was analyzed. The analysis concluded with an identification of proposed best management practices and mitigation measures to avoid, minimize, and compensate for potential adverse impacts. This analysis uses methods similar to those included in the Phase I ESA process (American Society for Testing and Materials 2005), which is typically used when acquiring properties to evaluate the historical and current use of a site and determine whether the potential exists for hazardous materials use and/or release. However, this *Hazardous Materials Technical Memorandum* does not meet the standards or nor constitute a Phase 1 ESA of the project area. A Phase I ESA of individual properties being acquired as part of this project would be conducted as part of the Final EIS and prior to acquisition in order to identify recognized environmental conditions and assess and limit environmental liability (See Section 5).

3.4.1 Existing Data Review

Potential impacts from hazardous materials were evaluated by gathering information from a variety of sources to identify potential or existing conditions that could pose environmental concerns.

3.4.1.1 Database Listings

A search of local, state, and federal regulatory databases was conducted by Environmental Data Resources, Inc. (EDR) to identify individual sites of concern. The search by EDR also included a list of orphan sites that was reviewed to identify sites that may be in the area of potential impact. Orphan sites are sites that cannot be mapped by EDR due to inadequate or incomplete address information. Search distances were either 0.1 or 0.25 mile from the RLE Project alternative alignments and included all area in between them. The search distance was based on the nature of the sites included in the database and the separation distance at which impacts become unlikely. Figure 3-1 depicts the maximum search area. Table 3-1 summarizes the databases searched and the corresponding search distance. Table 3-1 also defines abbreviations that are used hereafter in descriptions of sites.

3.4.1.2 Historical Records

Available historical fire insurance and topographic maps and aerial photographs were reviewed to identify previous land uses with a potential for hazardous material concerns. Sanborn fire insurance from 1897, 1911, 1938–39, 1950, 1975–76 and 1989 (EDR 2012a) were available. Topographic maps available included the Calumet Quadrangle from 1892, 1893, 1900, and 1901 (Historical Information Gatherers, Inc. [HIG] 2012b); the Calumet Lake Quadrangle from 1929 and 1953 (HIG 2012c); the Lake Calumet Quadrangle from 1960, 1965, 1973, 1977, 1991, and 1997 (HIG 2012d); and the Blue Island Quadrangle from 1929, 1953, 1963, 1973, 1978, and 1997 (HIG 2012e). Available aerial photographs of the project were available for the years 1938, 1952, 1962, 1973, 1974, 1983, 1984, 1998, 1999, and 2009 (HIGa).

Figure 3-1: Maximum Regulatory Database Search Area

Based on the database listing and historical records evaluation, a review of files from the IEPA and USEPA was conducted for sites located within or adjacent to the RLE project alternative alignments and where hazardous materials were identified as a high level of concern. Files were reviewed for information on enforcement actions, results of previous investigations, and cleanup status.

3.4.2 Impact Analysis

The information gathered from the existing data review was evaluated to identify specific sites where hazardous materials are known or suspected to exist and to determine the potential for the other sources of hazardous materials to be present. The potential permanent and/or construction impacts that each alternative would have were evaluated. Permanent impacts could be associated with maintenance activities during operation if maintenance activities also require earthmoving in potentially contaminated areas or that require the use of hazardous substances or petroleum products. Examples of maintenance activities that could require earthmoving include at-grade track repair, underground utility work and foundation repairs. Construction impacts could occur when activities such as earthmoving encounter contaminated soil and/or groundwater.

Table 3-1: Environmental Databases and Distances Searched

Database Name		Search Distance from Project Limits (miles)
Federal Databases	National Priority List Sites (NPL)	0.25
	Delisted NPL Sites	0.25
	Comprehensive Environmental Response, Compensation and Liability Information System Sites (CERCLIS)	0.25
	CERCLIS-No Further Remediation Planned Sites (CERC-NFRAP)	0.25
	RCRA Corrective Action Sites (RCRA CORRACTS)	0.25
	RCRA Treatment, Storage, and Disposal Sites (RCRA TSDF)	0.25
	RCRA Large Quantity Hazardous Waste Generators (RCRA LQG)	0.25

	Northeastern Illinois Planning Commission Active and Inactive Solid Waste Disposal Site Inventory (NIPC)	0.25
	Spill Incident List (SPILLS)	0.10
	Drycleaners License List (IL DRYCLEANERS)	0.10

A determination was made regarding the level of concern associated with each of the specific sites identified in the existing data review, using the guidance discussed in Section 3.2 and based on the following criteria:

- **High Concern** - Sites with known/probable soil, groundwater, or soil gas contamination that have not been remediated, or where remediation was incomplete or undocumented and that are within close proximity to the project and the potential for off-site migration is high. High Concern sites typically result in the potential for an adverse impact.

- **Moderate Concern** - Sites with known/potential soil, groundwater, or soil gas contamination and where remediation is in progress, or contaminants do not appear to pose a concern for a project. Sites may also be considered a Moderate Concern based on the proximity to the project and type and intensity of former land use (e.g., chemical manufacturers, machine shops, gas stations), even if they did not otherwise have an environmental database listing. Moderate Concern sites may or may not present the potential for an adverse impact, depending on the proximity to the project and extent of contamination.

- **Low Concern** - Sites where hazardous materials or petroleum products may have been or are stored, but where there is no known contamination associated with the property based on all available information. These sites may include sites with permitted air toxic emissions or sites with spills or leaks that were subsequently remediated and have received case closure. The sites may also include sites that have known contamination, but are far enough away from the project to make impacts unlikely. Low Concern sites typically do not result in the potential for an adverse impact.

- **No Concern** - Sites that, based on the review of all available information and on the type of site and distance from the project, are not likely to pose a concern for the project. No Concern sites typically do not result in the potential for an adverse impact.

An evaluation was conducted of potential impacts associated with other sources of hazardous materials, including PCBs, buildings, or structures built before 1978 that may contain lead-based paint, and buildings or structures built before 1979 that may contain asbestos. The evaluation was limited to determining whether there was the potential for transformers and buildings constructed prior to 1978 or 1979 to be present. Recommendations for avoiding and minimizing potential hazardous impacts, as well as potential mitigation measures, were also developed.

As part of this analysis, other current and reasonably foreseeable projects and future actions identified as part of the indirect and cumulative impacts analysis were reviewed to determine whether there would be any potential indirect or cumulative impacts associated with hazardous material.

Section 4
Affected Environment

4.1 Physical Setting

Elevations in the project area range from approximately 590 to 615 feet above sea level. Lake Michigan is the dominant topographic feature in the region and is approximately 4.8 miles from the project area at its closest point near the UPRR Rail Alternative alignment. Lake Calumet is in the eastern portion of the project area, and the Little Calumet River flows along the southern boundary of the project area. Shallow soils in the area are predominately classified as urban, generally characterized as highly disturbed as a result of human activities. The soils have been altered through grading, paving, excavation, or infilling. Largely underlying the urban fill in the region is glacial till and thin deposits of silt, clay, and sand of the Equality Formation (Illinois State Geological Survey 1971).

Groundwater generally flows from areas of higher surface elevation to areas of lower surface elevation and toward the nearest surface water body. The dominant flow direction for groundwater underlying the site is assumed to be to the northeast towards Lake Michigan. Groundwater in the project area is part of the deep bedrock Cambrian-Ordovician aquifers. Wells drilled into this aquifer range from 800 to 1,500 feet deep. Shallow, perched groundwater identified in the Chicago area is not utilized as private or municipal drinking water sources as there is a City of Chicago groundwater ordinance prohibiting the installation of new potable water supply wells within the city. Further detail on the groundwater of the project area is presented in the *Water Resources Technical Memorandum.*

4.2 Historical Document Review

Historical aerial photographs, topographic maps, and fire insurance maps covering the potential area of impact were reviewed to determine the general historical land use. The review determined that portions of the project area have been developed since 1892 and that rail lines have been present in or near the corridor since that time. The following sections provide a summary of the review for each source.

4.2.1 Topographic Maps

Historic United States Geologic Survey topographic maps obtained from HIG were reviewed for the Calumet Quadrangle from 1892, 1893, 1900, and 1901 (HIG 2012b); for the Calumet Lake Quadrangle from 1929 and 1953 (HIG 2012c); for the Lake Calumet Quadrangle from 1960, 1965, 1973, 1977, 1991, and 1997 (HIG 2012d); and for the Blue Island Quadrangle from 1929, 1953, 1963, 1973, 1978, and 1997 (HIG 2012e). The maps are not generally at a scale that permits identification of individual sites of concern but they do show general land use over time. The density of streets increased considerably between 1889 and 1929, after which development was primarily limited to isolated areas throughout the project area. The Red Line currently in use is first depicted on the topographic maps starting in 1973 (Lake Calumet Quadrangle).

The UPRR, Canadian National/Metra Electric and South Shore Lines and their predecessors (Chicago and Eastern Illinois Railroad and the Illinois Central Railroad) were first depicted in 1892 (Calumet Quadrangle).

4.2.2 Aerial Photographs

Aerial photographs obtained from HIG (2012a) were reviewed for the years 1938, 1952, 1962, 1973, 1974, 1983, 1984, 1998, 1999, and 2009. Aerial photographs are not generally at a scale that permits identification of potential impacts associated with specific sites, but they provide information on changes in land use and development over time. The 1938 aerial photograph showed that the majority of the project area was already developed with notable exceptions being the area along Halsted Street between 107th and 115th Streets and south of 124th Street. The area along the current South Shore Line was undeveloped south of 115th Street.

Historical land use within the area of potential impact is primarily a mix of residential and commercial use, with pockets of industrial use. Two notable large areas of historical industrial use were noted. The first area is between 119th and 121st Streets west of Halsted Street. The second area is between 115th Street where the UPRR and South Shore Line meet and 130th Street. The greatest increase in development occurred between 1938 and 1952, particularly in the areas identified as undeveloped in the 1938 aerial photograph. Changes in land use in subsequent years did occur, but were generally limited to individual buildings and properties rather than change at a broad scale.

4.2.3 Sanborn Fire Insurance Maps

Historic Sanborn Fire Insurance Maps were requested from EDR for the areas within and adjacent to the UPRR and Halsted Rail Alternative alignments. For the BRT Alternative, only maps within and near the areas of proposed park & ride facilities at the 103rd, 111th, 115th, and 130th Street BRT stop locations were requested. Maps were provided for the years 1897, 1911, 1938-39, 1950, 1975–76 and 1989 (EDR 2012a) for three distinct areas: I-94 from 95th Street to 98th Street, Halsted Street from 98th Street to 130th Street, and UPRR from 98th Street to 130th Street. The UPRR area included coverage of the proposed park & ride facilities at the 115th Street and 130th Street stop locations. For the areas with no Sanborn coverage, aerial maps were used to identify changes in land use and development over time (See Section 4.2.2).

These maps were reviewed to identify past commercial or industrial activities and sources commonly associated with hazardous material use. The review identified uses typical of an urban setting throughout the corridor including coal yards, lumber yards, gas stations, auto repair shops, machine shops, manufacturing plants, USTs, a pump station, and substations. Sites that are considered a potential concern are summarized by alternative in the following sections.

4.2.3.1 BRT Alternative

By 1897, R.A. Viall, a feed mill with two coal sheds, and some residences were present within the area of the proposed park & ride facility for the 115th Street stop. By 1911, additional residences and Armour & Co., which had office, storage, and cooler areas, were also present in this area and R.A. Viall had an auto repair shop that was not present in 1897. By 1939, R.A. Viall was replaced with a junkyard and although not shown by name, Armour & Co. (or a different company with similar food cooling operations) was still present. By 1950, there were no significant changes from 1939. By 1975, the food cooling operation and junkyard were still present and a filling station had been built to the north of the food cooling operation. By 1989, the area of the proposed 115th Street park & ride facility was similar to 1975 with the exception of the junkyard, which was no longer depicted in the 1989 map.

The Metropolitan Water Reclamation District of Greater Chicago's (MWRD) Calumet Water Reclamation Plant, a wastewater treatment plant within the area of the proposed park & ride facility for the 130th Street stop, first appeared in Sanborn maps in 1950. The MWRD Calumet Water Reclamation Plant was depicted at 126th Street and extending at least two to three blocks south. Settling tanks, ash lagoons, and aerating tanks were shown in both 1950 and 1975. By 1989, the details regarding the type of operations at the MWRD Calumet Water Reclamation Plant were no longer provided but the limits of the operations appeared to extend to 130th Street, which is farther south than shown in previous years.

4.2.3.2 UPRR Rail Alternative

The Roseland Manufacturing Co. was present at 11010 S. Stewart Avenue in 1897. By 1911, the Roseland Pumping Station was constructed at 351 W. 104th Street. By 1938–39, Commonwealth Edison had a substation at 117th Street and Front Street. By 1950, Hoper Equipment Co. and Chicago Hydraulic Oil Co. were present at 116th Street and Front Street. By 1975, there was a paint factory at 11740 S. Calumet Avenue, a metal finishing shop at 11730 S. Front Street, the Aluminum Screen Co. at 116th Street and Front Street, and a transformer yard at 96th Street and Lafayette Avenue.

The proposed 120th Street yard and shop site south of 119th Street and north of 120th Street, the area along the UPRR easements, and the proposed UPRR Rail Alternative alignment have been developed with railroads and railroad yards dating back to 1897 with the Chicago & Eastern Illinois Railroad and the Chicago & Western Indiana. Heavy industry in and around the proposed 120th Street yard and shop area included the Michigan Central RR Transfer Elevators and Transfer House (121st Street and UPRR track), the J.H. Winterbotham & Sons Cooperage (120th Street and UPRR track), and the Pullman Brick Works (north of 119th Street). The MWRD wastewater treatment plant, which is within the area of the proposed South and West Station Options, is discussed in Section 4.2.3.1

4.2.3.3 Halsted Rail Alternative

Developments within the Halsted Rail Alternative alignment included the Southwest Substation at 10229 S. Halsted Street in 1938–39, the Commonwealth Edison 119th Street Substation at the southeast corner of 119th Street and Halsted Street in 1950, and a transformer yard at 96th Street and S. Lafayette Avenue in 1976.

The proposed 119th Street yard and shop, which would be primarily between 119th and 120th Streets west of Halsted Street, is part of what is known as the West Pullman Industrial Redevelopment Area (WIRA). The WIRA generally extends from 117th Street on the north to

122nd Street on the south, Loomis Street on the west and Halsted Street on the east (Chicago 2012). The first three blocks west of Halsted Street between 119th and 121st Streets have been developed with heavy industry dating back to 1897, including the West Pullman Lumber Yard (gas tank), the Burgland and Shead Packing Pail Factory, the Akron Mining & Manufacturing Co., the Smith & Jones Boot & Shoe Co., and the Carter White Lead Works (linseed oil tanks). By 1911, the lumberyard and Carter White Lead Works had expanded and the West Pullman Car Works (gas tank) was present, with additional coal yards west of Peoria Street. By 1938-39, the lumberyard had scaled back and the Neuswanger Coal Co. and West Pullman Iron & Metal Co. now took up a portion of its previous footprint, In addition, the West Pullman Car Works was replaced with an auto wrecking facility, Safety Vulcanizer Co. (foundry), and Louis E. Emerman & Co. and Carter White Lead Co. was now National Lead Co. The area west of Morgan Street was developed by Ingersoll Steel (oil tanks) and International Harvester. The Texas Company bulk oil storage area is at 12100 S. Green Street with 13 underground gasoline tanks and oil storage. By 1950, the area remained similar to 1938-39 with the exception of the auto wrecking area and Safety Vulcanizer Co. no longer labeled as such. By 1975, Neuswanger Coal Co. was a junkyard, Louis E. Emerman & Co. was renamed to Caine Steel Co., and the lumberyard was no longer depicted. By 1989, the area between 119th and 1120th Streets was similar to 1975 but the area between 120th and 121st Streets was depicted as empty.

4.3 Regulatory Agency Records Review

The purpose of the records review was to assess the potential for the presence of hazardous substance contamination within and/or adjacent to the project area as a result of activities conducted on properties within the area of potential impact. The state and federal database listings were searched by EDR, an independent information service, on August 10, 2012 (EDR 2012b). The EDR report in Appendix B provides a listing and description of the databases reviewed, search distances, and a map showing the approximate locations of listed sites and information contained within each database for each listed site.

Table 4-1 summarizes the databases searched and the number of sites found within the search distance for each database. Table 4-1 also defines abbreviations that are used in this document when referring to sites.

Table 4-1: Environmental Database Search Results Summary

	Database Name	Number of Sites within Search Distance*		
		BRT	UPRR Rail	Halsted Rail
Federal Databases*	National Priority List Sites (NPL)	0	0	0
	Delisted NPL Sites	0	0	0
	Comprehensive Environmental Response, Compensation, and Liability Information System Sites (CERCLIS)	2	4	4
	CERCLIS-No Further Remediation Planned Sites (CERC-NFRAP)	1	2	2
	RCRA Corrective Action Sites (RCRA CORRACTS)	0	2	1
	RCRA Treatment, Storage and Disposal Sites (RCRA TSDF)	0	1	0
	RCRA Large Quantity Hazardous Waste Generators (RCRA LQG)	0	3	0
	RCRA Small Quantity Hazardous Waste Generators (RCRA SQG)	10	23	31
	RCRA Conditionally Exempt Hazardous Waste Generators (RCRA CESQ)	10	13	7
	Engineering Controls Sites (US ENG CONTROLS)	0	0	0
	Institutional Control Sites (US INST CONTROL)	0	0	0
	Brownfield Sites (US BROWNFIELDS)	0	0	0
	Emergency Response Notification System (ERNS)	6	9	3
State Databases*	Illinois State Sites Unit Listing (SSU)	0	2	1
	Site Remediation Program (SRP)	4	4	19
	Engineered Barrier Site (ENG CONTROLS)	1	2	4
	Institutional Control Site (INST CONTROLS)	2	1	6
	Leaking Underground Storage Tank Sites (LUST)	22	24	29
	Underground Storage Tank Sites (USTs)	41	41	54
	Former Manufactured Gas Plant Sites (MGP)	0	0	0
	Brownfield Sites	0	0	1
	Landfill or solid waste disposal sites (SWF/LF)	0	1	0
	Northeastern Illinois Planning Commission Active and Inactive Solid Waste Disposal Site Inventory (NIPC)	0	0	0
	Spill Incident List (SPILLS)	22	33	21
	Drycleaners License List (IL DRYCLEANERS)	1	1	4

Notes

BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad

* EDR searched additional databases besides those included in this table; however, based on the nature or type of these databases, they were not used in the evaluation of potential impacts and therefore are not listed here. EDR also identified a list of orphan sites (sites reported as potentially being in the project area but which could not be mapped due to inadequate or incomplete address information). These sites were also reviewed and when possible, sites were classified.

4.4 Regulatory File Review

The regulatory file review was limited to those sites that presented the greatest concern. The majority of sites identified in the database review are typical for a highly urban area with a history of commercial and industrial use; therefore, regulatory files were not reviewed for all sites.

Records were requested for certain sites due to their large size, proximity to the RLE Project, and potential environmental concerns associated with listings as a LUST, SRP, and/or CERCLIS site. The purpose of the request was to determine which, if any, records exist regarding known contamination from past activities at the sites and/or to confirm the exact location and property boundaries. In addition, the information was used to determine the level of concern associated with each site. Regulatory files were requested from the City of Chicago, the IEPA, and/or the USEPA depending on the type of site. Table 4-2 summarizes the regulatory file request. Records have been received for all requested sites. Summaries of the records and determination of the level of concern are provided in the following sections.

Table 4-2: Regulatory Records Request Summary

IEPA = Illinois Environmental Protection Agency, USEPA = U.S. Environmental Protection Agency, FOIA = Freedom of Information Act
* All addresses are within Chicago.

4.4.1 BRT Alternative

4.4.1.1 Pullman Factory (130th Street and Indiana Avenue)

The Pullman Factory site (also known as the Pullman Sewage Farm) is approximately 90 feet from the proposed park & ride facility location at 130th Street. The site is listed under CERCLIS. The Expanded Site Inspection Final Report ([Final Report] Alternative Remedial Contracting Strategy 1994) summarized the activities completed at the site. According to the Final Report, the 140-acre site was used for land application of untreated industrial and domestic sewage from 1881 to 1907 and was later developed as a residential neighborhood. A preliminary assessment conducted by IEPA in 1987 indicated a medium priority with potential and alleged groundwater, surface water and soil contamination. A 1990 USEPA site inspection determined that site soils had low levels of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, and metals, indicating that portions of the site may have been impacted by the historic activities. Sampling conducted for the Final Report confirmed the presence of low levels of VOCs, SVOCs, pesticides, and metals in site soils. Available documentation for this site indicates that no remedial actions have been completed; however, because the level of contamination identified was low, this site is a Low Concern.

4.4.1.2 Clark Oil & Refining (11555 S. Michigan Avenue)

The former Clark Oil & Refining service station is adjacent to the proposed park & ride facility at 115th Street. The facility had one 7,500-gallon and two 6,000-gallon gasoline USTs removed in

1991. The surrounding soils were heavily impacted, resulting in the removal of 2,880 cubic yards of contaminated soil. Groundwater was not encountered. The 45-Day Report completed in 1992 for LUST Incident #912512 (O'Brien & Associates, Inc. 1992) indicated benzene exceedances along the west sidewalls of the excavation. Additional removal was not feasible due to the close proximity of the sidewalk to Michigan Avenue. The IEPA requested the installation of a passive soil vent system. There is no documentation indicating that the passive system was ever installed; however, IEPA issued a No Further Remediation (NFR) letter for this site on January 9, 1995. Although IEPA issued an NFR letter, this site is a Moderate Concern because residual contamination may still remain.

4.4.1.3 Altgeld Gardens (300 E. to 1100 East 130th Street; 100 E. to 1200 W. 131st Street; 1100-1200 E. 130th Place; 1000-1200 E. 129th Place)

Altgeld Gardens is across the street from the proposed park & ride facility at 130th Street. According to the Agency for Toxic Substances & Disease Registry website, USEPA conducted a site investigation at Altgeld Gardens in 1996 in response to community concerns. The investigation included the collection of ten surficial soil samples, taken across the entire community. Based on the 1996 findings, soil impacted with PCBs was remediated in the area from 940 to 975 E. 132nd Street. The Illinois Department of Public Health concluded that based on the limited information available, there was no public health hazard that exists from exposure to surface soil contamination; however, further assessment was recommended (Agency for Toxic Substances & Disease Registry 2012). This site is a Low Concern.

4.4.2 UPRR Rail Alternative

4.4.2.1 City of Chicago/Roseland Pumping Station (351 W. 104th Street)

The City of Chicago/Roseland Pumping Station is approximately 50 feet from the UPRR Rail Alternative ROW Option permanent envelope, adjacent to the East Option permanent envelope, and approximately 120 feet from the West Option permanent envelope. The facility was historically a hazardous waste generator of flammable waste liquids. A LUST incident was reported in 1994 (#942419) related to overfill and was identified during the removal of a 550-gallon diesel tank. The Site Classification Completion Report (United Environmental Consultants 1995) indicated no benzene, toluene, ethylbenzene, and xylenes (BTEX) or PNA compound exceedances and the IEPA issued an NFR letter dated September 19, 1995; therefore, this site is a Low Concern.

4.4.2.2 Illinois Bell Telephone (413 W. 105th Street)

The Illinois Bell Telephone site is adjacent to the UPRR Rail Alternative ROW Option permanent envelope, approximately 70 feet from the East Option permanent envelope, and within the West Option permanent envelope. The facility had four USTs that were removed in 1988: three fuel oil tanks and a waste oil tank. This site had one LUST incident (#880112) that appears to have been associated with the removal of a 5,000-gallon fuel oil UST on February 8, 1988 along the west side of the building. The remaining three USTs were removed from the north end of the building on March 24, 1988. Subsequent documentation (ATEC Associates, Inc. 1988) indicated the LUST Incident #880112 is also associated with these tanks.

A Corrective Action Completion Report for the LUST incident was submitted in 2004 (STS Consultants, Ltd. [STS] 2004) and the IEPA issued an NFR letter dated March 21, 2005. The site may have remaining contamination associated with the first UST; therefore, this site is a High Concern.

4.4.2.3 William Ransom Transportation (352 W. 110th Street)

The William Ransom Transportation site is adjacent to the UPRR Rail Alternative ROW Option permanent envelope, within the East Option permanent envelope, and approximately 110 feet from the West Option permanent envelope. A 6,000-gallon gasoline UST was removed in 1999 and was given LUST Incident #990399 due to odors in the backfill materials. A 45-Day Report was completed in March 1999, indicating that perched water was encountered and the assumed contamination was left in place (Environmental Management and Resource Consultants, Inc. 1999). No other documentation was available. Because contamination may still remain, this site is a High Concern.

4.4.2.4 Marquette Bank (135-139 W. 114th Street)

The Marquette Bank site is adjacent to the UPRR Rail Alternative ROW Option permanent envelope, within the East Option permanent envelope, and approximately 120 feet from the West Option permanent envelope. A 2,000-gallon gasoline UST was removed in 2001 and was given LUST Incident #20011638 due to piping failure. Seventy-five cubic yards of soil were removed and a Corrective Action Completion Report was completed in November 2001 (Aspen Environmental, Inc. 1991). Groundwater was not encountered and IEPA issued an NFR letter on January 25, 2002 with no restrictions, indicating that the remaining soil and groundwater concentrations were below Tier I residential remedial objectives; therefore, this site is a Low Concern.

4.4.2.5 Triangle Transmission (35 W. 115th Street)

The Triangle Transmission site is adjacent to the UPRR Rail Alternative ROW Option permanent envelope, within the East Option permanent envelope, and approximately 130 feet from the West Option permanent envelope. A 1,000-gallon gasoline UST was removed in 1999 and LUST Incident #992324 was assigned (Illinois Emergency Management Agency 1999). No other documentation was available. Because contamination may still remain, this site is a High Concern.

4.4.2.6 City of Chicago/Abandoned Service Station (11500 S. Perry Avenue)

The City of Chicago/Abandoned Service Station is 60 feet from the ROW Option permanent envelope, 160 feet from the East Option permanent envelope, and within the West Option permanent envelope. A Phase I ESA of the vacant site identified several environmental concerns, including the presence of urban soil/fill, historic presence of a filling station, UST removal and subsequent LUST Incident #20002342 (gasoline), historic presence of up to eight USTs on site, and a UST pump and piping distribution system (The Shaw Group 2011). The gasoline and waste oil USTs were removed on December 11, 2000 by the City of Chicago. No additional remediation was completed. The City of Chicago was exempt from further reporting or corrective actions as they were not the owner and/or operator of the USTs (IEPA 2001).

A Phase II ESA included a geophysical survey, ten soil borings, and three temporary groundwater wells. The soil analytical data indicated the presence of VOCs, mercury, and lead at concentrations exceeding one or more TACO Tier 1 remediation objectives (See Section 3.1.2.1). Groundwater samples identified benzene at a concentration exceeding both the Class I and Class II Groundwater Ingestion Standards in a sample taken along the eastern property boundary (The Shaw Group 2011). No documentation of remediation was available and because contamination may still remain, this site is a High Concern.

4.4.2.7 Clark Oil & Refining (11555 S. Michigan Avenue)

The former Clark Oil & Refining service station site is within the UPRR Rail Alternative ROW and East Option permanent envelope and approximately 240 feet from the West Option permanent envelope. This site is described in Section 4.4.1.2 and is a Moderate Concern.

4.4.2.8 Stuart Industrial Coatings, Inc. (11740 S. Front Street)

The Stuart Industrial Coatings site is within the permanent envelopes of all three UPRR Rail Alternative options. The facility had seven USTs that were removed in 1990: one 3,000-gallon toluene tank and six 1,000-gallon tanks containing xylene, Varnish Makers & Painter naphtha, methyl ethyl ketone, mineral spirits, ethylene acetate, and methyl isobutyl ketone (Best Environmental, Inc. 1991). The site was given LUST Incident #900054. Contaminated soil was removed and stockpiled. Additional information was requested by IEPA in 2001; however, no additional documentation was available. Because contamination may still remain, this site is a High Concern.

4.4.2.9 Keywell LLC (11900 S. Cottage Grove Avenue)

The Keywell LLC site is within the permanent envelopes of all three UPRR Rail Alternative options. Two 2,000-gallon gasoline tanks were removed in 1990, resulting in LUST Incident #902351. Samples indicated the remedial objectives were exceeded for BTEX. Approximately 240 cubic yards of impacted soil and 3,150 gallons of impacted rainwater were subsequently removed (RERC Environmental 1990). Additional soils were removed in 1994 as part of a new dock construction project (NTH Consultants, LTD 1994). The IEPA granted site-specific remedial objectives and the site was granted an NFR letter dated January 24, 1996. Although IEPA has issued an NFR, this site is a High Concern because this site has a long history of industrial use and is currently used as a scrap metal processing facility

4.4.2.10 Pullman Factory (130th and Indiana Avenue)

The Pullman Factory site is approximately 1,200 feet from the 130th Street South Station Option site and approximately 130 feet from the West Station Option site. This site is described in Section 4.4.1.1 and is a Low Concern.

4.4.2.11 Illinois Central Railroad Tracks (119th Street, East of Central Tracks)

The Illinois Central Railroad Tracks site is within the permanent envelopes of all three potential UPRR Rail Alternative Options. The site, which is listed as a CERCLIS-NFRAP site, lies along the tracks at 119th Street. A Site Inspection Report completed in 1987 (Ecology & Environment [E&E]

1987) indicated on-site drum storage from historic aerial photograph review; however, the actual site inspection did not identify drum storage or any additional concerns. Although railroads in general are a potential concern for hazardous material impacts (See Section 4.6), this specific database listing is a Low Concern because no reported release has occurred.

4.4.2.12 US Scrap (123rd and Cottage Grove Avenue)

The US Scrap site is a CERCLIS site approximately 1,000 feet from the permanent envelopes of all three UPRR Rail Alternative Options. It operated as an open dump in the 1960s and 1970s as part of a drum reclamation facility. A 1980 IEPA inspection discovered four hundred 55-gallon drums of waste, liquid wastes stored in eight concrete silos, scattered surficial deposits of wastes, several waste lagoons, and sludge in drainage swales (USEPA 2011). A Site Assessment prepared for the USEPA (STN Environmental JV 2007) determined that site soils were heavily contaminated with PCBs, chlorinated solvents, lead, and cadmium. Surface liquids showed high levels of vinyl chloride, BTEX, PNAs, pesticides, and PCBs.

A removal action completed in 2008 included the installation of sheet piling between the US Scrap and adjacent MWRD site; installation of interceptor trenches to remove liquid wastes; excavation and disposal of PCB-contaminated soils; geophysical survey for buried drums; and overpacking and disposal of drums (USEPA 2011). Although removal action has occurred, this site is a High Concern because extensive contamination still remains.

4.4.2.13 Penn Central Corp. and Lake Calumet Quad (810 E. 124th Street)

The Penn Central Corp. and Lake Calumet Quad sites are within the permanent envelopes of all three UPRR Rail Alternative Options. The Penn Central Corp. site is listed as an SSU site and Lake Calumet Quad is a CERCLIS-NFRAP site. Although these sites are have different names and are listed in separate databases, based on records reviewed, they appear to be the same site and associated with the same activities. The Penn Central Corp. site was identified on a map in a US Scrap report as a hazardous waste illegal dump site due to historic dumping operations (E&E 1990). Reports for both Penn Central Corp. and Lake Calumet Quad stated that over 400,000 gallons of liquid waste were pumped from the basement of on-site grain silos (STS 1982; E&E 1991). A slurry wall was proposed to contain the soils and groundwater impacted with BTEX and chlorinated solvents. There is no documentation that remediation has occurred or that the slurry wall was installed. Because contamination may still remain, this site is a High Concern.

4.4.2.14 Metro Sanitary District #3 (125th Street and Doty Avenue)

The Metro Sanitary District #3 site is approximately 350 feet from the permanent envelopes of all three UPRR Rail Alternative Options. The site is listed as a CERCLIS-NFRAP site and is within the MWRD Calumet Water Reclamation Plant site. A Site Inspection Report was completed in 1986 (E&E 1986), which indicated that the site included a partial, inactive landfill that was used for disposal of sand, gravel, and grit from sewage treatment by MWRD. Surface samples that were collected indicated the presence of PCBs, chloroform, chlorodane, chromium, lead, toluene, and 4,4-dichlorodiphenyldichloroethane (DDD). There were multiple seeps on the western property boundary from the adjacent US Scrap property. As no reported removal or cleanup has occurred, this site is a High Concern.

4.4.2.15 Altgeld Gardens (300 E. to 1100 East 130th Street; 100 E. to 1200 W. 131st Street; 1100-1200 E. 130th Place; 1000-1200 E. 129th Place)

This site is adjacent both the South Station and West Station Option sites for the 130th Street station and is described in Section 4.4.1.3. This site is a Low Concern.

4.4.3 Halsted Rail Alternative

4.4.3.1 Mobil Oil Corp. SS A8B (9901 S. Halsted Street)

This site is within the Halsted Street Rail Alternative permanent envelope. The facility has four active gasoline USTs and records for five additional USTs. The status of the five additional USTs is unknown. The 45-Day Report completed in 1998 for LUST Incident #980630 (Handex of Illinois, Inc. 1998) indicated elevated levels of BTEX in soil and groundwater. The site was classified as a high priority site by the IEPA in 1999. A Corrective Action Plan was rejected by the IEPA in 2009. The LUST incident is still open and contamination may still remain; therefore, this site is a High Concern.

4.4.3.2 Omnitrax (11955 S. Morgan Street)

This site is within the proposed 119th Street yard and shop area and within WIRA Study Area 8. The site is enrolled in the SRP. It is one of 17 study areas within the WIRA, an area of industrial land use dating back to the late 1800s that extends from 117th Street on the north to 122nd Street on the South, Loomis Street on the west and Halsted Street on the east. The WIRA study areas are in various stages of investigation, remediation, and redevelopment by the City of Chicago, private property owners and/or perspective owners and developers. The Comprehensive Site Investigation Report completed in 2007 (Gabriel Environmental Services [Gabriel] 2007) indicated the presence of undissolved (free) product, PNAs, arsenic, lead, hazardous lead, and PCBs. Certain areas were remediated and an engineered barrier was put in place. Additional investigation (Gabriel 2012) indicated the remaining portions of the property still contained elevated levels of PNAs, lead, and PCBs. In addition, the site still had soil with levels of lead that exceeded the hazardous waste disposal thresholds. Because contamination may still remain, this site is a High Concern.

4.4.3.3 West Pullman Iron and Metal Co. (11954 S. Peoria Street)

This site is within the proposed 119th Street yard and shop area and within WIRA Study Area 8. The facility was a scrap yard and was used to dismantle transformers. A 1990 Site Assessment identified PCB-impacted soils at (Weston Solutions, Inc. [Weston] 1990). There is no documentation that remediation has occurred; therefore, contamination may still remain on site and this site is a High Concern.

4.4.3.4 Carl Buddig (11954 S. Peoria Avenue)

This site is within the proposed 119th Street yard and shop area. This site is within the northern portion of WIRA Study Area 8 along the south side of 120th Street. The site is enrolled in the SRP. A Phase II ESA was completed in 2004 for this property, formerly operated by Carl Budding. The Phase II ESA indicated that 2,4-dinitrotoluene, 2,6-dinitrotoluene, and chromium exceed the TACO Soil migration to groundwater exposure route and lead exceeds the ingestion exposure route and has affected the groundwater at the site (Tetra Tech, Inc. [Tetra Tech] 2004a). Because contamination may still remain, this site is a High Concern.

4.4.3.5 WIRA Study Area No. 6 (11931 S. Loomis Street)

This site is within the proposed 119th Street yard and shop area and is also part of the WIRA (See Section 4.2.3.3). This site is enrolled in the SRP. A review of a Comprehensive Site Investigation Report for this site, which is referred to as the Christ Universal Temple Property (Former International Harvester Property) and WIRA Study Area 6, indicated elevated levels of arsenic. The average detected arsenic values were at levels below background (Tetra Tech 2000a). IEPA issued an NFR letter in 2005 restricting the use of the site to industrial/commercial. Because the NFR letter includes restrictions, this site is a Moderate Concern.

4.4.3.6 WIRA Study Area 9 (820 W. 120th Street)

The WIRA Study Area 9 is within the proposed 119th Street yard and shop area. The site is enrolled in the SRP. The WIRA Study Area 9 was most formerly occupied by West Pullman Car Works and is currently occupied by Abbey Metal Corporation. A Phase II ESA was completed for a portion of WIRA Study Area 9 at 11955 South Peoria Street (Tetra Tech 2004b). The Phase II ESA indicated that VOCs, SVOCs, metals, and PCBs are present in the soil, primarily from 0 to 3 feet below ground surface and that lead and nickel are present in the groundwater. Because contamination may still remain and is primarily within the top 3 feet, this site is a High Concern.

4.4.3.7 WIRA Study Area Number 14 (815 to 825 W. 120th Street)

WIRA Study Area Number 14 is within the proposed 119th Street yard and shop area; it is also part of the WIRA (See Section 4.4.3.1) and is known as The Steel Company site. The site is enrolled in the SRP. The contaminants identified at Study Area Number 14 are VOCs, SVOCs, and metals. The SVOC impacts appear to be localized in the areas of the former railroad tracks and machinery warehouse. In addition, SVOCs were not detected below 3 feet below ground surface. Lead is present at concentrations exceeding TACO Tier 1 remediation objectives throughout the central part of Study Area No. 14. The antimony and selenium concentrations in one soil boring sample exceeded the TACO Tier 1 remediation objective (Tetra Tech 2000b).

Free product is present near the former oil UST. Two groundwater samples contained concentrations exceeding TACO Tier 1 Class I remediation objectives, one with benzene and metals and another with metals (Tetra Tech 2000b). Because contamination may still remain, this site is a High Concern.

4.4.3.8 Ingersoll (1000 West 120th Street)

The Ingersoll site is within the proposed 119th Street yard and shop area and is a CERCLIS site. It is also part of the WIRA (See Section 4.2.3.3) and has been developed as an industrial site since the late 1800s. Multiple Phase I and II ESAs and remedial action have been completed. The current property has had all structures demolished with thousands of gallons of non-hazardous and impacted wastewater removed from the site along with asbestos and PCB debris. However, the site still has free product remaining on-site and soils impacted with PNAs, metals, and PCBs. In addition, it is considered an active CERCLIS site with USEPA enforcement actions (Tetra Tech

2005b; Tetra Tech 2007; Weston 2007). Because contamination may still remain, this site is a High Concern.

4.4.3.9 Exelon Solar Plant/Chicago Malleable Castings/Vacant Lot (1201 W. 120th Street)

This site is south of the proposed 119th Street yard and shop area and is part of the WIRA (See Section 4.2.3.3). This site is enrolled in the SRP and is also a LUST and UST site. It is also referred to as the Chicago Building Structure Site and WIRA Study Areas 10 and 11. The Comprehensive Site Investigation Report for this site identified exceedances of Tier 1 remedial objectives for SVOCs and various metals in soil and for lead in groundwater (Tetra Tech 2001a). The Comprehensive Site Investigation Report recommended averaging soil sample results or conducting a Tier 3 assessment to address these exceedances. Although IEPA has not issued this site an NFR letter, remediation has occurred and it was redeveloped in 2010 as part of the Exelon Corporation’s Exelon City Solar site, which now operates as a solar photovoltaic power plant (Exelon Corporation 2012; Mazza 2012). This site has not been issued an NFR letter from IEPA and although remediation has occurred, this site is a Moderate Concern because contamination may still remain.

4.4.3.10 Dutch Boy Paint (1200 and 12042 S. Peoria Avenue, 900 W. 120th Street)

The Dutch Boy Paint site (also identified as the National Lead site) is adjacent to the south of the proposed 119th Street yard and shop area. This site is listed as a CERCLIS site. Documentation indicated the presence of hazardous lead levels across the site. Hazardous lead levels were remediated according to a Consent Decree (Cook County 1999), the site was entered into the SRP. The 2009 Comprehensive Site Investigation Report identified PNAs, arsenic, lead, and PCBs above TACO Tier I remedial objectives for ingestion. Groundwater modeling indicated that lead had the potential to migrate off-site. In addition, the site still had soil with levels of lead that exceeded the hazardous waste disposal thresholds, as well as potential free product (Tetra Tech 2005a; Tetra Tech 2009; Tetra Tech 2010). Because contamination may still remain, this site is a High Concern.

4.5 Risk Classification

Using the impact analysis criteria described in Section 3.4.2 and results of the existing data review described in Sections 4.2, 4.3, and 4.4, the identified sites were classified as No, Low, Moderate or High Concern sites based on their potential to act as a source of contamination to each of the RLE Project alternatives. Figure 4-1 shows the sites identified in the database review and associated concern classification.

With the exception of certain sites associated with the UPRR Rail Alternative, each site was assigned one classification, based on its potential to have caused soil and/or groundwater contamination in the area and its proximity to the project area. For the UPRR Rail Alternative, if applicable, a site was assigned a unique classification for each of the three options (ROW, East, and West). The potential impacts associated with these sites may vary by alternative and are discussed in Section 5.0.

4.5.1 High Concern Sites

The review identified 36 High Concern sites, summarized in Table 4-3. The majority of these sites were classified as High Concerns due to both their proximity (typically inside or within 500 feet of an alternative's permanent envelope) and being listed as CERCLIS, CORRACTS, CERCLIS-NFRAP, SSU, and/or an open LUST or SRP site. Open LUST or SRP sites have not been issued an NFR letter from the IEPA, which indicates that a release has been identified but remediation is likely not complete. Two High Concern sites included in Table 4-3 were classified as high based on the use of the site (Metropolitan Water Reclamation District/Calumet Water Reclamation Plant, a wastewater treatment plant, Figure 4-1 Site ID 200) or information received from a regulatory file request that identified contamination (Carl Buddig, Figure 4-1 Site ID NL1).

As shown in Table 4-3, several High Concern sites lie within the permanent envelope of the alternatives. These sites have the highest potential to affect the RLE Project (see Table 4-4 and Figures A-1 through A-7 in Appendix A).

4.5.2 Moderate Concern Sites

Fifty-six sites were classified as Moderate Concern sites. These sites were typically CERCLIS-NFRAP (archived) and UST sites with no identified releases adjacent to or within a proposed alternative's permanent envelope; LUST and SRP sites that have been issued NFR letters with restrictions (such as engineered barriers and/or instructional controls) and are adjacent to or within a proposed alternative's permanent envelope; open LUST and SRP sites between 300 and 500 feet from an RLE alternative alignment or feature; and CERCLIS, SWL/F and CORRACTS sites within 1,320 feet (0.25 mile) of an RLE alternative alignment or feature. At distances greater than these, the likelihood of contamination traveling from these types of sites and affecting the RLE Project is low. Table 4-5 contains a list of the Moderate Concern sites.

4.5.3 Low and No Concern Sites

Sites not identified as either a High or Moderate Concern were classified as either Low or No Concern. Low Concern sites typically included SQG and CESQG hazardous waste generators, USTs not adjacent to the RLE alternative alignments or features and LUST and SRP sites more than 0.1 mile away. Sites greater than 0.25 mile from any alternative alignment or feature were typically classified as No Concern sites.

Notes:

* Environmental Data Resources, Inc. (EDR) ID is the site ID number provided in the EDR database report (Appendix B). More than one site has the same EDR ID; therefore, each High Concern site was given a unique “Figure ID,” used in Figures 4-2 through 4-8.

** Addresses are in Chicago unless otherwise noted.

*** Separation distance is measured from the edge of the permanent envelope for an alternative. ‘Within’ means the site would be inside the permanent envelope. E=East Option, W=West Option, ROW=ROW Option, n/a = High Concern classification is not applicable to that option.

**** The Databases listed are those that contributed information relevant to the site’s designation as a High Concern site. See Tables 3-1 and 4-1 for distances evaluated, summaries, and definitions of abbreviations.

Notes:

* Environmental Data Resources, Inc. (EDR) ID is the site ID number provided in the EDR database report (Appendix B). More than one site has the same EDR ID; therefore, each High Concern site was given a unique "Figure ID," used in Figures 5-2 through 5-9.

** Addresses are in Chicago unless otherwise noted.

*** Separation distance is measured from the edge of the permanent envelope for an alternative. 'Within' means the site is inside the permanent envelope. E=East Option, W=West Option, ROW=ROW Option, n/a = Moderate Concern classification is not applicable to that option.

**** The Databases listed are those that contributed information relevant to the site's designation as a High Concern site. See Tables 3-1 and 4-1 for distances evaluated, summaries, and definitions of abbreviations.

***** These sites are all part of the former Amforge site, which has received and NFR and been redeveloped.

4.5.4 Summary

Table 4-6 presents a summary of the number of High and Moderate Concern sites associated with each alternative.

Table 4-6: Summary of High and Moderate Concern Sites

Segment	High Concern	Moderate Concern
Bus Rapid Transit Alternative		
Full Length	2	11
Park & Ride Facilities*	1	4
Union Pacific Railroad Rail Alternative ROW Option		
Segment UA	7	8
Segment UB	10	9
Union Pacific Railroad Rail Alternative East Option		
Segment UA	7	8
Segment UB	10	9
Union Pacific Railroad Rail Alternative West Option		
Segment UA	7	9
Segment UB	9	9
Halsted Rail Alternative		
Segment HA	15	23
Segment HB	5	7

*Includes Moderate and High Concern sites only within or near the proposed park & ride facilities.

4.6 Other Sources

Other common sources of hazardous materials that may be present or that could affect the project were considered. Review of the Certified Sanborn maps confirmed that substations have been present since at least 1938. Prior to 1979, when their production was banned, PCBs were commonly used as fluid in electrical equipment. Transformers and substations within the project area may contain PCBs. The historical review also confirmed that the majority of buildings and structures within the project area were built before 1978–1979. Therefore, the majority of these buildings and structures are likely to contain lead-based paint or asbestos.

The long-term operation and maintenance of the existing UPRR and the NICTD/CSS & SBRR corridors adjacent to and within the project area are also potential sources of hazardous material impacts (UPRR Rail Alternative). Maintenance activities typically require the use of fuel, oil, paints, solvents, and cleaning agents for equipment, and grounds maintenance that may have contaminated the soil and/or groundwater from the use of materials such as herbicides, and pesticides. Operation of both lines includes carrying freight traffic, which may include hazardous materials transport. In addition, other potential sources of hazardous material impacts from railroad operations could include creosote used to preserve wood railroad ties, polynuclear aromatic carbon deposition from diesel exhaust, asbestos dust from brakes, coal ash releases from engines, and hazardous material cargo. Although a search of the National Response Center Database, which provides reported oil and chemicals spill data for railroad incidents, did not identify any spills reported by UPRR, NICTD, CSS, or SBRR along the project area, the potential for impacts still exists. (National Response Center 2012)

Given the urban setting of the project area, the potential exists for the presence of typical urban fill throughout the entire project area. Typical urban fill materials contain elevated concentrations of polynuclear aromatic hydrocarbons and metals due to nearby roadways, railways, and industrial and commercial lands uses and activities. Industrial and commercial land uses and activities include coal yards, gas stations, auto repair shops, machine shops, manufacturing plants, dry cleaners, USTs, substations, and transformers. This type of contamination is not necessarily associated with a release from a specific site or source. In addition, urban fill may include contaminated building demolition debris, which was commonly used as fill material in excavations, to increase elevations at sites during development.

Section 5
Impacts and Mitigations

The evaluation of the affected environment found the potential to encounter hazardous materials across the entire project area during both construction and operation. This section analyzes and compares the hazardous material impacts of the RLE Project alternatives in one of three categories: permanent impacts, construction impacts, and cumulative impacts.

5.1 No Build Alternative

Under the No Build Alternative, there would be no construction other than that associated with already funded and committed projects in the corridor. For the No Build Alternative, no permanent adverse impacts, construction impacts, or cumulative impacts related to hazardous materials would be expected.

5.2 Bus Rapid Transit Alternative

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

Operating BRT service and park & ride facilities would not result in changes to the existing types of hazardous materials used, stored or transported. Therefore, no permanent adverse impacts related to hazardous materials would be associated with the BRT Alternative.

5.2.2 Construction Impacts and Mitigations - Bus Rapid Transit Alternative

5.2.2.1 Impacts

Subsurface excavation associated with the BRT Alternative would occur during construction of all four of the proposed park & ride facilities; however, excavated quantities would likely be greater at Kensington Avenue and 130th Street than at 103rd Street and 111th Street. This difference is because the Kensington Avenue and 130th Street facilities both would have garages, which would require more excavation to install their foundations and other support structures. Therefore, construction for this alternative would result in generation of a large quantity of soil that could contain contaminated materials requiring off-site disposal. The source of hazardous material impacts could be from sites identified in the database review or from the presence of urban fill. In addition there is the potential that groundwater encountered during construction may contain contaminated materials. As summarized in Table 4-4 and shown on Figure 4-6, one High Concern site (ID Number 200) was identified within or near a proposed park & ride facility site where the majority of subsurface excavation and potential adverse impacts would be likely to occur. This High Concern site is near the proposed 130th Street facility site and is an operating wastewater treatment plant. Sludge, a byproduct of the wastewater treatment process, typically contains heavy metals and other contaminants and may be present throughout the site, including within the footprint of the proposed park & ride facility at 130th Street.

In all areas besides the park & ride facilities, work would be limited to the surface and the potential for impacts to hazardous materials would be low.

Construction of park & ride facilities at 103rd Street and Kensington Avenue would include demolition of existing structures that were likely constructed before 1978–1979. These structures may contain asbestos-containing material and lead-based paint that could result in a release of asbestos fibers and lead dust during construction. Hazardous materials typically involved with construction activities, such as paints, solvents, fuels, and hydraulic fluids, could also be released accidentally during construction.

Implementation of the BRT Alternative could also result in beneficial impacts through the cleanup and/or removal of contaminated material (soil, groundwater, and/or asbestos and lead-based paint particles) during construction. Without this alternative, this cleanup and removal would occur either at a later date or not at all.

Indirect impacts could occur from the accidental release of hazardous materials during the transport of soil or other contaminated media to a disposal facility away from the project area.

5.2.2.2 Mitigation

Mitigation measures for the BRT Alternative would be used to avoid and minimize impacts prior to and during construction and would, at a minimum, include the following:

- Compliance with federal, state, and local laws and regulations regarding hazardous materials would be required.

- Focused site assessments would be required for areas where earth-moving activities would occur. The assessments would include characterization and evaluation of the potential for encountering hazardous materials and contaminated soils.

- Asbestos, lead-based paint, and hazardous material surveys of buildings or structures would be required prior to renovation or demolition, to identify any asbestos and lead-based paint particles and hazardous materials, such as PCB- or mercury-containing equipment. Any hazardous materials identified would be abated and disposed of in accordance with local, state and federal regulations.

- A Contaminated Material Management Plan that provides the procedures for identifying, characterizing, managing, storing, and disposing contaminated soil and groundwater encountered during construction activities would be required. This plan would cover the entire project area, as it is assumed that all material has at least some level of contamination associated with it. Contaminated material generated during construction would be disposed of at a nearby facility permitted to accept such material, such as the Veolia ES Zion Landfill, in Zion, Illinois (non-hazardous special waste) and the Menomonee Falls Treatment Storage and Disposal Facility in Menomonee Falls, Wisconsin (hazardous waste).

- Health and Safety Plans for construction activities would be developed by the contractors and read and signed by all workers prior to starting any work. The Health and Safety Plans would identify potential contaminants of concern, required personal protection equipment and procedures, and emergency response procedures.

- Spill Prevention, Control, and Countermeasure Plans to address the use, storage, and disposal of materials such as asphalt, fuel, paint, solvents, and cleaning agents would be required. The Spill Control and Prevention Plans would provide best management practices to limit the potential for accidental releases of potentially hazardous materials.

- Construction Stormwater Pollution Prevention Plans, which describe methods to prevent or minimize stormwater runoff from encountering contaminated soil or other hazardous materials, would be required.

In addition to the above, a Phase I ESA of any property to be purchased would be conducted as part of the Final EIS in order to identify recognized environmental conditions and assess and limit environmental liability. Based on the Phase I ESA findings, a Phase II ESA could also be required during the property acquisition phase and prior to purchasing a property.

5.2.3 Cumulative Impacts and Mitigations - Bus Rapid Transit Alternative

Under the BRT Alternative, cumulative impacts could occur if there were a release of hazardous materials during ongoing and future projects in the area (described in the *Cumulative Impacts Technical Memorandum)*; however, compliance with local, state, and federal laws and regulations would result in these cumulative impacts being less than adverse.

5.3 Union Pacific Railroad Rail Alternative

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.1.1 Segment UA

5.3.1.1.1 Impacts

Operation of UPRR Rail Alternative ROW Option, a heavy rail transit line, would have the potential to result in the release of hazardous materials and/or petroleum products into the environment from accidental spills or from maintenance activities that require earthmoving in contaminated areas. Spills are most likely to occur during activities such as equipment maintenance at the yards and shops and grounds maintenance along the tracks. Materials typically used for these activities include fuel, oil, paints, solvents, cleaning agents, herbicides, and pesticides. Examples of maintenance activities that could require earthmoving include at-grade track repair, underground utility work, and foundation repairs.

5.3.1.1.2 Mitigation

During operation of the ROW Option, mitigation measures would include adherence to applicable federal, state, and local regulations, as well as CTA's existing system-wide hazardous material usage, storage, and disposal plans and procedures.

5.3.1.2 Segment UB

Permanent impacts and mitigation measures would be similar to those described for Segment UA in Section 5.3.1.1. However, there would be the potential for additional impacts associated with the NICTD/CSS & SBRR, which is an active railroad and is adjacent to Segment UB. Due to the proximity of NICTD/CSS & SBRR to Segment UB, hazardous material spills or releases that occur along the NICTD/CSS & SBRR during its operation and maintenance would have the potential to migrate affect the UPRR Rail Alternative alignment within this segment. Section 4.6 describes typical sources of hazardous material spills and releases that may be associated with NICTD/CSS & SBRR. Although there is the potential for impacts associated with the adjacent freight line, these impacts would be reduced by the freight lines' adherence to federal hazardous material transport regulations (49 CFR Parts 171 to 180), Among other things, these regulations specify requirements for the safe transportation of hazardous materials by rail, and they require rail carriers to conduct a security and safety risk analysis to develop a security and safety risk plan that includes measures to mitigate risk to population centers, and to select the safest route.

5.3.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.2.1 Segment UA

5.3.2.1.1 Impacts

Construction of Segment UA of the UPRR Rail Alternative ROW Option would involve approximately 130,100 cubic yards of soil or aggregate excavation. Therefore, there would be the potential to encounter hazardous materials, whether from the sites identified in the database review or from the presence of urban fill. In addition, unlike the East and West Options, the ROW Option would include construction within the UPRR corridor, which is potentially impacted because of the use of fuel, oil, paints, herbicides, and pesticides, creosote, polynuclear aromatic hydrocarbons and coal ash associated with the long-term operation as a railroad (See Section 4.6). In addition, groundwater encountered during construction may contain hazardous materials.

As shown in Table 4-4, no High Concern sites are within the permanent envelope of Segment UA of the UPRR Rail Alternative ROW Option.

This alternative would include the demolition of existing structures that were likely constructed before 1978 - 1979. Potential issues associated with these structures would be as described for the BRT Alternative in Section 5.2.2.1.

Construction of Segment UA could also result in beneficial impacts through the cleanup and/or removal of contaminated material, as described for the BRT Alternative in Section 5.2.2.1.

Indirect impacts could occur from accidental releases as described for the BRT Alternative in Section 5.2.2.1.

5.3.2.1.2 Mitigation

Proposed mitigation measures would be similar to those described for the BRT Alternative in Section 5.2.2.2.

5.3.2.2 Segment UB

5.3.2.2.1 Impacts

Construction of Segment UB of the UPRR Rail Alternative ROW Option would involve approximately 140,100 cubic yards of soil or aggregate excavation. Therefore, impacts would be similar to those described for Segment UA in Section 5.3.2.1. One exception is that Segment UB is not directly within a freight railroad corridor, but it is adjacent to the NICTD/CSS & SBRR and railroad spurs serving the Keywell property (ID Number 151/162), which carries freight trains and could still have potential hazardous material impacts. While there would be the potential for hazardous material impacts associated with construction adjacent to a railroad, they would likely be fewer than for construction directly within the footprint of a railroad.

Based on the historic aerials and Sanborn fire insurance maps, heavy industry has been present in and along this segment since at least 1897. As shown in Table 4-4 and Figures 4-5 and 4-6, three High Concern sites (ID Numbers 122, 200, and 151/162) are within the permanent envelope of Segment UB of the UPRR Rail Alternative ROW Option. One High Concern site is within both the areas for the South Station and West Station Options (ID Number 200, See Section 5.2.2.1). Four additional High Concern sites (ID Numbers O1, O2, O3, and O4) are potentially within the permanent envelope but not enough information is available at the time of this report to determine their exact location.

Of note within this segment is that there are two CERCLIS Archived sites potentially within the permanent envelope (O3 and O3). The CERCLIS sites typically come with increased risk of the USEPA imposing liability and remediation obligations on potentially responsible parties (PRPs). Any owner can be considered a PRP and be required to pay for cleanup. These sites have Archived status, which means that USEPA has completed its assessment of the site and has determined that no future action will be taken to list it on the National Priorities List and has removed it from its inventory of Superfund sites. However, this does not mean that a site is considered clean, and additional caution should be taken before acquiring ownership.

5.3.2.2.2 Mitigation

Permanent impacts and mitigation measures would be similar to those described for Segment UA in Section 5.3.2.1.

5.3.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

Cumulative impacts under the UPRR Rail Alternative ROW Option would be similar to those under the BRT Alternative, described in Section 5.2.3.

5.3.4 120th Street Yard and Shop

5.3.4.1 Permanent Impacts and Mitigations

Permanent impacts and mitigation measures for the 120th Street yard and shop would be similar in type to those described for the UPRR Rail Alternative ROW Option, Segment UA (Section 5.3.1.1); however, the quantities of materials used (including fuel, oil, paints, solvents, cleaning agents, herbicides, and pesticides) and therefore, the potential for spills to occur, would likely be greater at the yard and shop than along the rail line itself.

5.3.4.2 Construction Impacts and Mitigations

Construction of the 120th Street yard and shop would involve approximately 138,100 cubic yards of soil or aggregate excavation. Impacts and mitigation measures would be similar to those described for Segment UB in Section 5.3.2.2, with the exception of one less High Risk site (ID Number 122, a LUST site) within or potentially within the permanent envelope of the yard.

5.3.5 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

5.3.5.1 Segment UA

5.3.5.1.1 Impacts

Permanent impacts under the UPRR Rail Alternative East Option would be similar to those for the UPRR Rail Alternative ROW Option, described in Section 5.3.1.1. However, there would be the potential for additional impacts associated with the operation of the adjacent active UPRR, which would remain in operation under the East Option. Given the proximity of the UPRR track to the alignment for the East Option, there would be the potential for impacts due to releases of hazardous materials being transported and from hazardous materials used in the routine operation and maintenance of the UPRR. Hazardous materials potentially exist along the railroad currently, but the UPRR Rail Alternative would bring transit vehicles closer to them. Although there is the potential for impacts associated with the adjacent freight line, these impacts would be reduced by the freight lines' adherence to federal hazardous material transport regulations (See Section 5.3.1.2).

5.3.5.1.2 Mitigation

Mitigation measures would be similar to those for the UPRR Rail Alternative Rail ROW Option, described in Section 5.3.1.1. It is presumed that in addition to the CTA, the UPRR would follow its own system-wide hazardous material usage, storage, and disposal plans and procedures. The UPRR would also adhere to federal hazardous material transport regulations (49 CFR Parts 171 to 180) that among other things, specify requirements for the safe transportation of hazardous materials by rail and require the rail carrier to conduct a security and safety risk analysis, develop a security and safety risk plan that includes measure to mitigate risk to population centers, and to select the safest route.

5.3.5.2 Segment UB

Permanent impacts and mitigation measures would be similar to those for Segment UA of the UPRR Rail Alternative East Option, described in Section 5.3.5.1; however, instead of potential impacts from the adjacent operating UPRR, Segment UB would have potential impacts from the adjacent operating NICTD/CSS & SBRR.

5.3.6 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

5.3.6.1 Segment UA

Construction of Segment UA of the UPRR Rail Alternative East Option would involve approximately 122,900 cubic yards of soil or aggregate excavation. Construction impacts and mitigation would be similar to those for Segment UA of the UPRR Rail Alternative ROW Option, described in Section 5.3.2.1. However, as shown in Table 4-4 and Figures 4-3 and 4-4, the East Option would include three High Concern Sites (ID Numbers 70, 94a and 104) within its permanent envelope compared to none in the ROW Option. These three sites are all LUST sites.

5.3.6.2 Segment UB

Construction impacts and mitigation would be similar to those for Segment UB of the UPRR Rail Alternative ROW Option, described in Section 5.3.2.2.

5.3.7 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

Cumulative impacts would be similar to those under the BRT Alternative, described in Section 5.2.3.

5.3.8 120th Street Yard and Shop

5.3.8.1 Permanent Impacts and Mitigations

Permanent impacts and mitigation measures would be similar to those described for the UPRR Rail ROW Alternative in Section 5.3.4.1.

5.3.8.2 Construction Impacts and Mitigations

Permanent impacts and mitigation measures would be similar to those described for the UPRR ROW Alternative in Section 5.3.4.2.

5.4 Union Pacific Railroad Rail Alternative - West Option

5.4.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

5.4.1.1 Segment UA

Permanent impacts and mitigation measures would be similar to those described for the UPRR Rail Alternative East Option in Section 5.3.5.1.

5.4.1.2 Segment UB

Permanent impacts and mitigation measures would be similar to those described for the UPRR Rail Alternative East Option in Section 5.3.5.2.

5.4.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

5.4.2.1 Segment UA

Construction of Segment UA of the UPRR Rail Alternative West Option would involve approximately 129,400 cubic yards of soil or aggregate excavation. Construction impacts and mitigation would be similar to those for Segment UA of the UPRR Rail Alternative ROW Option, described in Section 5.3.2.1. However, as shown in Table 4-4 and Figures 4-2 and 4-4, the West Option would include two High Concern Sites (ID Numbers 51 and 105) within its permanent envelope, compared to none in the ROW Option and three in the East Option. These three sites are all LUST sites.

5.4.2.2 Segment UB

Construction impacts and mitigation would be similar to those for Segment UB of the UPRR Rail Alternative ROW Option, described in Section 5.3.2.2.

5.4.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

Cumulative impacts would be similar to those for the BRT Alternative, described in Section 5.2.3.

5.4.4 120th Street Yard and Shop

5.4.4.1 Permanent Impacts and Mitigations

Permanent impacts and mitigation measures would be similar to those described for the UPRR ROW Alternative in Section 5.3.4.1.

5.4.4.2 Construction Impacts and Mitigations

Construction impacts and mitigation measures would be similar to those described for the UPRR ROW Alternative in Section 5.3.4.2.

5.5 Halsted Rail Alternative

5.5.1 Permanent Impacts and Mitigations - Halsted Rail Alternative

5.5.1.1.1 Impacts

Operation of Halsted Rail Alternative, a heavy rail transit line, would have the potential to result in the release of hazardous materials and/or petroleum products into the environment from accidental spills. Spills are most likely to occur during activities such as equipment and grounds maintenance. Materials typically used for these activities include fuel, oil, paints, solvents, cleaning agents, herbicides, and pesticides.

5.5.1.1.2 Mitigation

During operation of the Halsted Rail Alternative, adherence to applicable federal, state, and local regulations, as well as CTA's existing system-wide hazardous material usage, storage, and disposal plans and procedures, would minimize the potential for impacts.

5.5.2 Construction Impacts and Mitigations - Halsted Rail Alternative

5.5.2.1 Segment HA

5.5.2.1.1 Impacts

Construction of Segment HA of the Halsted Rail Alternative would involve approximately 83,400 cubic yards of soil or aggregate excavation. Therefore, there would be the potential to encounter hazardous materials, whether from the sites identified in the database review or from the presence of urban fill. In addition, groundwater encountered during construction may contain hazardous materials.

As shown in Table 4-4 and Figure 4-7, there is one High Concern site (ID Number 18a) within the permanent envelope of Segment HA of the Halsted Rail Alternative: an open LUST site.

Construction of Segment HA would include the demolition of existing structures that were likely constructed before 1978 - 1979. Potential issues associated with these structures would be as described for the BRT Alternative in Section 5.2.2.1.

Construction of Segment HA could also result in beneficial impacts through the cleanup and/or removal of contaminated material, as described for the BRT Alternative in Section 5.2.2.1.

Indirect impacts could occur from accidental releases as described for the BRT Alternative in Section 5.2.2.1.

5.5.2.1.2 Mitigation

Proposed mitigation measures would be similar to those described for the BRT Alternative in Section 5.2.2.2.

5.5.2.2 Segment HB

5.5.2.2.1 Impacts

Construction of Segment HB of the Halsted Rail Alternative would involve approximately 57,900 cubic yards of soil or aggregate excavation and demolition of existing structures that were likely constructed before 1978-1979. Therefore, impacts would be similar those described for to Segment HA in Section 5.5.2.1.

As shown in Table 4-4, no High Concern sites are within the permanent envelope of Segment HB of the Halsted Rail Alternative. Potential beneficial impacts and indirect impacts would also be similar to those described for Segment HA in Section 5.5.2.1.

5.5.2.2.2 Mitigation

Permanent impacts and mitigation measures would be similar to those described for the BRT Alternative in Section 5.2.2.2.

5.5.3 Cumulative Impacts and Mitigations - Halsted Rail Alternative

Cumulative impacts under the Halsted Rail Alternative would be similar to those described for the BRT Alternative in Section 5.2.3.

5.5.4 119th Street Yard and Shop

5.5.4.1 Permanent Impacts and Mitigations

Permanent impacts and mitigation measures would be similar to those described for the 120th Street yard and shop in Section 5.3.4.1.

5.5.4.2 Construction Impacts and Mitigations

5.5.4.2.1 Impacts

Construction of the 119th Street yard and shop would involve approximately 129,100 cubic yards of soil or aggregate excavation. Therefore, there would be the potential to encounter hazardous materials, and impacts would be similar to those described for Segment HA in Section 5.5.2.1.

Based on the historic aerials and Sanborn fire insurance maps, industry has been present within the proposed yard permanent envelope since at least 1897. As shown in Table 4-4 and Figure 4-8, six High Concern sites (ID Numbers 141, 144, 152a, 154, NL1, and 152b) are within the permanent envelope of the 119th Street yard and shop.

Of note within this segment are the one CERCLIS site (Ingersoll, ID Number 154) and one CERCLIS-NFRAP site (West Pullman Iron and Metal Co., ID Number 144) within the permanent envelope. As discussed in Section 5.3.2.2, CERCLIS sites typically come with increased risk of the USEPA imposing liability and remediation obligations on PRPs. Any owner can be considered a PRP and be required to pay for cleanup. The Ingersoll site is of special concern given that there are free product and known USEPA enforcement actions at the site (See Section 4.4.3). The NFRAP status at the West Pullman Iron and Metal Co. site means that means that USEPA has completed its assessment of the site and determined that no future action will be taken to list it on the National Priorities List. However, this does not mean that a site is considered clean, and additional caution should be taken before acquiring ownership. In addition to the sites within the permanent envelope of the 119th Street yard and shop, there is also an active CERCLIS site, Dutch Boy (ID Number 159 and 153) adjacent to the south (See Figure 4-1) of the 119th Street yard and shop, which based on available information, has the potential for off-site migration of contamination.

Construction of the 119th Street yard and shop would include the demolition of existing structures that were constructed before 1978 and 1979. Potential issues associated with these structures would be as described for the BRT Alternative in Section 5.2.2.1.

Potential beneficial impacts and indirect impacts would be similar to those described for Segment HA in Section 5.5.2.1.

5.5.4.2.2 Mitigation

Proposed mitigation measures would be similar to those described for the BRT Alternative in Section 5.2.2.2.

Section 6
Impacts Remaining After Mitigation

6.1 No Build Alternative

No permanent impacts, construction impacts, or cumulative impacts related to hazardous materials would be expected to be associated with the No Build Alternative. Therefore, there would also be no impacts remaining after mitigation.

6.2 Bus Rapid Transit Alternative

No hazardous material impacts would remain after mitigation.

6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

No hazardous material impacts would remain after mitigation.

6.3.1 Segment UA

No hazardous material impacts would remain after mitigation.

6.3.2 Segment UB

No hazardous material impacts would remain after mitigation.

6.3.3 120th Street Yard and Shop

No hazardous material impacts would remain after mitigation.

6.4 Union Pacific Railroad Rail Alternative - East Option

No hazardous material impacts would remain after mitigation.

6.4.1 Segment UA

No hazardous material impacts would remain after mitigation.

6.4.2 Segment UB

No hazardous material impacts would remain after mitigation.

6.4.3 120th Street Yard and Shop

No hazardous material impacts would remain after mitigation.

6.5 Union Pacific Railroad Rail Alternative - West Option

No hazardous material impacts would remain after mitigation.

6.5.1 Segment UA

No hazardous material impacts would remain after mitigation.

6.5.2 Segment UB

No hazardous material impacts would remain after mitigation.

6.5.3 120th Street Yard and Shop

No hazardous material impacts would remain after mitigation.

6.6 Halsted Rail Alternative

No hazardous material impacts would remain after mitigation.

6.6.1 Segment HA

No hazardous material impacts would remain after mitigation.

6.6.2 Segment HB

No hazardous material impacts would remain after mitigation.

6.6.3 119th Street Yard and Shop

No hazardous material impacts would remain after mitigation.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

The Map ID column refers to the Map ID-Focus Map(s) of the listed site.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 12/27/2011 has revealed that there are 8

EXECUTIVE SUMMARY

CERCLIS sites within the searched area.

PULLMAN FACTORY	130TH ST & INDIANA	202-15

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA’s knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 12/28/2011 has revealed that there are 5 CERC-NFRAP sites within the searched area.

EXECUTIVE SUMMARY

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 03/15/2012 has revealed that there is 1 RCRA-TSDF site within the searched area.

SHERWIN WILLIAMS CO	***11541 S CHAMPLAIN AVE***	***112-7,8***

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/15/2012 has revealed that there are 3 RCRA-LQG sites within the searched area.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/15/2012 has revealed that there are 71 RCRA-SQG sites within the searched area.

RCRA-CESQG: RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/15/2012 has revealed that there are 29 RCRA-CESQG sites within the searched area.
